POPULATION ESTIMATES

FOR RELEASE

January 23, 1956

Washington 25, D. C.

Series P-25, No. 130

ESTIMATES OF THE CIVILIAN POPULATION OF STATES, BY BROAD AGE GROUPS JULY 1, 1950 TO 1954

(The estimates given in this report for 1950 to 1953 supersede the corresponding estimates published in Current Population Reports, Series P-25, No. 106. The figures in this report are consistent with the revised estimates of the total population published in Current Population Reports, Series P-25, No. 124.)

Estimates of the civilian population of States in five broad age groups are presented in this report: Under 5 years old, 5 to 17 years old, 18 to 44 years old, 45 to 64 years old, and 65 years old and over.¹ In addition, the age groups under 21 years old and 21 years old and over are shown.

These estimates were obtained by carrying forward the 1950 Census data on each of the age groups for the United States and for each State and adjusting for births, civilian deaths, net civilian international and interstate migration between April 1, 1950, and the estimate dates, and net movement of civilians into the Armed Forces for the same periods. Finally, the estimates of the population of the five broad age groups for each State were adjusted proportionately to add to the total population of the State, and the estimates of the population of each age group for the States were adjusted to add to the population in the age group for the United States.

The estimates of net migration were developed basically by the method described as

¹ Estimates for some of the age groups shown in this report were prepared at the request and expense of the National Office of Vital Statistics and the Children's Bureau, Department of Health, Education, and Welfare.

"Method II" in Current Population Reports, Series P-25, No. 20. The description given in that report does not include any of the several recent improvements² in the "migration-and-natural-increase" method upon which the estimates in this report are based. A revision of Series P-25, No. 20, is scheduled to be published in the next several months.

Method II involves first the estimation of net migration rates for children 7½ to 14½ years old on the basis of data from the 1950 Census and statistics of elementary school enrollment in grades 2 to 8. Net migration rates for children 7½ to 14½ years of age had already been developed for use in preparing the estimates of the total population of States presented in Current Population Reports, Series P-25, No. 124. In preparing the estimates of the population of each of the age groups shown in this report, it was assumed, with only minor exceptions, that the rate of net migration for the population in each of these groups between April 1, 1950, and the estimate dates for a given State bore the following relationships to the rate for school age children of the same State 7½ to 14½ years of age:

² See Current Population Reports, Series P-25, No. 124, for a brief description of these recent improvements in Method II.

Age group	Ratio of migration rate for age group to that for group 7½ to 14½ years old
Under 5 years.....	1.7
5 to 17 years.....	1.0
18 to 64 years.....	1.3
18 to 20 years.....	1.9
21 to 64 years.....	1.3
21 to 44 years.....	1.7
45 to 64 years.....	0.5
65 years and over.....	0.3

Thus, it is assumed, for any State, that the direction of its net migration was the same for all of these age groups. The estimates of net civilian migration for each age group for States were adjusted by a ratio method to add algebraically to the national estimate of net immigration in the particular age group for the same period. The above assumptions concerning migration by age was based on a study of annual interstate migration data classified by age for recent years obtained in the Current Population Survey for the United States.

The net movement of civilians into the Armed Forces for each State was estimated by (1) taking the difference between (a) the number of persons serving in the Armed Forces on the estimate date who reported the State as their preservice residence and (b) the number serving in the Armed Forces on April 1, 1950, who reported the State as their preservice residence, and (2) adding an allowance for former residents of the State who died during this period while serving in the Armed Forces.

The data on births available for preparing these population estimates include final figures classified on a residence basis for 1952 and provisional figures classified on an occurrence basis for 1953 and 1954. The 1953 and 1954 "occurrence" figures were adjusted to a residence basis. All figures were corrected for underregistration. The factors used in correcting the births for underregistration are extrapolated from results of the 1950 Birth Registration Test conducted by the National Office of Vital Statistics in conjunction with the 1950 Census of Population. The estimates of deaths used in preparing these population estimates were developed from estimates of deaths classified by age, for the United States as a whole for 1950 to 1954, and from tabulations of resident deaths classified by age, for each State for 1950 to 1952. The

adjustment of the death statistics for underregistration was confined to infants under 1 year of age. The final estimates of births and deaths are expected to differ only slightly from those used.

The estimates given in this report are based on age data from the 1950 Census; statistics of births and deaths provided by the National Office of Vital Statistics, United States Public Health Service; statistics on the movement of persons into and out of the United States provided by the Immigration and Naturalization Service, Department of Justice; statistics relating to the Armed Forces provided by the Department of Defense; and estimates of net interstate migration, developed in part from official records of school enrollment obtained from State and Diocesan Departments of Education throughout the country.

In preparing the estimates shown in this report, the 1950 figures for the group under 5 years old were corrected for incompleteness in the enumeration of children in this age group. These corrected 1950 figures were derived from statistics on births, deaths, and migration, not from the census counts, and are given in table A-5 of the appendix to Current Population Reports, Series P-25, No. 106. At the same time, in order to maintain comparability with the 1950 Census figures in the sense that the net change for a given age group between the census date and the estimate date would not include the net census undercount, the estimates of the "true" total number of children under 5 years old, based on births, were deflated by the net census undercounts in the same age group (table A-4 of the appendix to Series P-25, No. 106).

The estimates of the population 5 to 17 years old presented in this report are believed to have relatively high accuracy, because they are based on data for all the components of population change that relate directly to the age group under consideration. The estimates of net migration are based on symptomatic data (school enrollment), but these cover fairly closely the age group that is being estimated. The general method used to estimate net migration does not involve, therefore, for the age group 5 to 17 years old, such broad assumptions as to the relation between the migration rate of elementary school age children and the migration rate of persons in the age group, as are required for the total population or the age groups outside the school ages.

The assumptions made as to net interstate migration for the other age groups are so broad that only relatively large differences in percentage change among States for these age groups can be relied upon. The estimates of the population of these age groups are val-

uable mainly as indicators of population levels and of broad patterns of change. Because of the nature of the migration assumption, changes by States in each of the age groups are fairly highly correlated with changes in the population of all ages over the same period.
