## PROJECTIONS OF THE WHITE AND NONWHITE POPULATION OF THE UNITED STATES, BY AGE AND SEX, TO 1985

(The projections for all classes were previously published in Current Population Reports, Series P-25, No. 329. The projections in this report are preliminary; revised figures are to be published later this year)

This report presents projections of the white and nonwhite population of the United States by age and sex from 1965 to 1985, which are consistent with the projections of the total population by age and sex previously published in Current Population Reports, Series P-25, No. 329. These projections are preliminary; they will be modified shortly to take account of changes recorded for 1965-66.

The accompanying tables show four series of projections of the white and nonwhite population from 1965 to 1985, designated A, B, C, and D. The projections relate to the 50 States and the District of Columbia and include Armed Forces abroad. Figures are given annually for the total white and nonwhite population and for every fifth year for the white and nonwhite population by age and sex. In the classification of the population as white or nonwhite, the group designated as nonwhite includes Negroes, American Indians, Japanese, Chinese, Filipinos, and other nonwhite races.

The figures are not offered as predictions of the future size of the population but indicate rather the approximate future level and age, sex, and color composition of our population under given assumptions as to future fertility, mortality, and net immigration.

A "component" method was used to develop the population projections for the total and nonwhite population, and projections of the white population were obtained as the difference. The component method involves the preparation of separate projections of each of the components of population change--births, deaths, and net immigration--on the basis of certain assumptions, and the combination of the projections of change with estimates of the current population. The benchmark for the population projections is the current estimates of the population, by age and sex, for July 1, 1965, published in Current Population Reports, Series P-25, No. 321. The projections of components involve the use of projections of age-specific survival rates for mortality, age-specific birth rates for fertility, and an assumption as to the total annual amount and age-sex distribution of net immigration. The four series of projections differ from one another wholly with respect to the assumptions employed relating to future fertility. The assumptions employed with regard to future mortality and net immigration are the same in all series.

Fertility and mortality were assumed to follow the general trends previously postulated for all classes during the projection period but with partial convergence between white and

nonwhite levels. The reduction of the difference between the mortality of whites and nonwhites is in line with past trends spanning many years. The reduction of the difference between the fertility of whites and nonwhites does not follow recent experience, but there is evidence to support an assumption of convergence of the rates in future years. For example, the Growth of American Families Study for 1960, a national sample survey relating to fertility and family planning in the United States, indicates that, on the average, nonwhite wives in the child-bearing ages want fewer children than they have and, in fact, want fewer than white wives; and, further, that the differences existing between nonwhite and white wives are associated with Southern farm background and low educational attainment, the influence of which should diminish in the future.<sup>1</sup> The projections of fertility for all classes incorporated in the population projections previously published were derived by the cohort method (i.e., in terms of assumed cumulative fertility rates for birth cohorts of women); the corresponding projections of nonwhite fertility were derived on the basis of the assumed relation between the age-specific birth rates for nonwhites and the age-specific birth rates for all classes implied by the cohort fertility data.

The specific assumptions underlying the projections are as follows:

1. The relative difference between the age-specific birth rates for the nonwhite population and those for all classes observed in the year 1965 would be reduced by 25 percent for Series A, 40 percent for Series B, 60 percent for Series C, and 75 percent for Series D by the year 2000. The extent of convergence of the nonwhite rates with those for whites would be a little more than with those for all classes. The total fertility rates for 1962-65, 1985, and 2000 implied by these assumptions are shown in table A. These figures indicate, for example, that if women bore children throughout their childbearing period at the age-specific birth rates assumed to prevail in 1985, the average white woman would have 2.4 to 3.2 children in her lifetime and the average nonwhite woman would have 2.9 to 4.3 children, according to whether the Series D or Series A assumption prevailed.

Table A.--TOTAL FERTILITY RATES, BY COLOR: 1962-65, 1985, AND 2000

(Figures represent the total number of children that would be born to 100 women during their lifetime if they experienced the birth rates at each age estimated or projected for the year or period shown)

Year and series	All classes	White	Non-white
1962 to 1965 <sup>1</sup> .....	330	315	431
1985			
Series A.....	340	323	431
Series B.....	313	299	389
Series C.....	278	268	335
Series D.....	243	236	286
2000			
Series A.....	335	318	416
Series B.....	310	298	369
Series C.....	278	271	313
Series D.....	245	242	264

<sup>1</sup> Period extends from July 1, 1962, to June 30, 1965.

2. The difference in the year 1963 between age-specific survival rates for the nonwhite population and those for all classes would be reduced by 50 percent by the year 2000. The values for the expectation of life at birth for 1963, 1985, and 2000 implied by this assumption are shown in table B. The table shows a moderate rise in life expectancy for the nonwhite population but indicates only a slight rise for the white population.

Table B.--LIFE EXPECTANCY AT BIRTH, BY COLOR AND SEX: 1963, 1985, AND 2000

Year and sex	All classes	White	Non-white
MALE			
1963.....	66.6	67.5	60.9
1985.....	68.0	68.7	63.6
2000.....	69.0	69.6	65.6
FEMALE			
1963.....	73.4	74.4	66.5
1985.....	74.6	75.4	69.4
2000.....	75.4	76.1	71.6

3. Net immigration would amount to 400,000 a year for all classes, corresponding approximately to the level estimated for the year July 1, 1965, to June 30, 1966. The distribution of immigrants by color, as well as by age and sex, would be the same as the estimated

average annual distribution of net immigration in the period from July 1, 1961, to June 30, 1964 (371,000), adjusted to include the additional immigrants (29,000) expected in future years. This assumption implies an annual net immigration of 367,000 whites and 33,000 nonwhites.

Table 1 presents the projections of the white and nonwhite population for each year from 1965 to 1985. Table 2 presents the components of population change (i.e., births, deaths, etc.) for the white population for each

year from 1950 to 1985. Table 3 presents the same type of figures for the nonwhite population. Table 4 presents projections of the white and nonwhite population by 5-year age groups and sex for every fifth year from 1965 to 1985.

\* \* \*

The figures in this report have been rounded independently to the nearest thousand from figures computed to the last digit; hence the sum of parts may differ from the totals shown.

Table 4.--ESTIMATES AND PROJECTIONS OF THE WHITE AND NONWHITE POPULATION OF THE UNITED STATES, BY AGE AND SEX:  
1965 TO 1985--Continued

(In thousands. Figures relate to July 1 and include Armed Forces abroad. For a description of the assumptions underlying the four series of projections, see text. Figures inside heavy lines represent, in whole or part, survivors of births for years after 1965)
