REVISED PROJECTIONS OF THE POPULATION OF STATES 1970 TO 1985

(This report presents more detailed figures than the Advance Report, Current Population Reports, Series P-25, No. 362, and supersedes the projections in report No. 326 of this series)

This report presents alternative series of projections of the population of States for 1970 to 1985, taking into account national population projections and estimates of State changes in population that have become available since the last State projections were prepared. Thus, they are consistent with the recent national population projections published earlier this year in Current Population Reports, Series P-25, No. 359, and with estimates of State population, by age, published in Series P-25, No. 354.

Four alternative series of projections are given here, based on reasonable alternative assumptions concerning future national fertility and interstate migration. (Only one assumption concerning future mortality is used.) For analytical purposes, a set of projections assuming no net migration is also shown. The projections are not intended as predictions, but rather as indications of the population distributions which would develop on the basis of the assumptions regarding births, deaths, and interstate migration which were selected.

In the identification of the four main series the letters "B" and "D" refer to the fertility assumptions employed and correspond to the national fertility designations given in Series P-25, No. 359. The designations "I" and "II" refer to the interstate migration assumptions used, with Series I representing a continuation of the migration rates within the range observed

in 1955-60 and 1960-65, whereas Series II assumes a change in the rates of that period toward national levels. Under both assumptions the rates are affected by estimated net interstate migration for the 1960-65 period. A detailed discussion of the assumptions will be found below under Methodology.

INDICATED CHANGES

Total population

Regions.—On the basis of these illustrative projections, the South would receive the largest share of the population growth projected for the nation from 1965 to 1985 and the West would continue to grow at the fastest rate. Under Series I-B the South would gain 22 million and the West 19 million of the total national projected growth of 70 million over the next 20 years. In terms of relative growth, however, the gain in the West represents 66 percent of its 1965 population compared with the South's gain of 37 percent of its 1965 population. National population growth under the lower fertility assumption of Series I-D would reduce the overall projected national growth from the 70 million indicated above to about 45 million, with roughly proportionate reductions in the gains for each of the four regions. Table A shows the total population projected for each of the regions for 1985 under the four different assumptions.

Table A.--ESTIMATES AND PROJECTIONS OF TOTAL RESIDENT POPULATION, BY REGIONS: 1965 AND 1985
(In millions)

Region	Estimates, 1965	Projections, 1985			
		Series I-B	Series II-B	Series I-D	Series II-D
United States.....	193.8	263.6	263.6	240.7	240.7
Northeast.....	47.6	61.0	61.4	56.0	56.4
North Central.....	54.1	68.7	69.3	62.7	63.3
South.....	60.1	82.7	82.9	75.2	75.3
West.....	32.0	51.3	50.0	46.8	45.7

To illustrate the range of the four main series as shown in table A, the West under Series I-B (continuation of recent migration patterns, and moderately high fertility) would have 51.3 million population by 1985. Smaller projected populations of the West result from the other series, with Series II-D (convergence of recent gross migration rates to a national average, and low fertility) yielding the lowest figure of 45.7 million.

In spite of its rapid growth, the West would still have less population in 1985 than any of the other regions according to all four series. However, its growth would increase its share of the Nation's population from 16.5 percent in 1965 to 19.4 percent in 1985 (Series I-B), continuing a long term trend as shown in figure 1 (frontispiece), and table B. The West's gain in population relative to the rest of the Nation would be at the expense of the Northeast and North Central Regions, with the South's share of national population remaining relatively stable at about 31 percent.

Table B.—REGIONAL DISTRIBUTION OF THE POPULATION OF THE UNITED STATES: 1940 TO 1985

(In percent. As of July 1. Alaska and Hawaii included in all years. Projections based on Series I-B)

Year	North-east	North Central	South	West
1940 ¹	27.2	30.4	31.6	10.9
1945 ¹	25.5	29.1	31.9	13.5
1950 ¹	26.0	29.4	31.2	13.4
1955 ¹	25.6	29.4	30.4	14.6
1960 ¹	24.9	28.7	30.7	15.7
1965 ¹	24.6	27.9	31.0	16.5
1970.....	24.2	27.2	31.3	17.3
1975.....	23.9	26.7	31.4	18.0
1980.....	23.5	26.3	31.4	18.8
1985.....	23.1	26.1	31.4	19.4

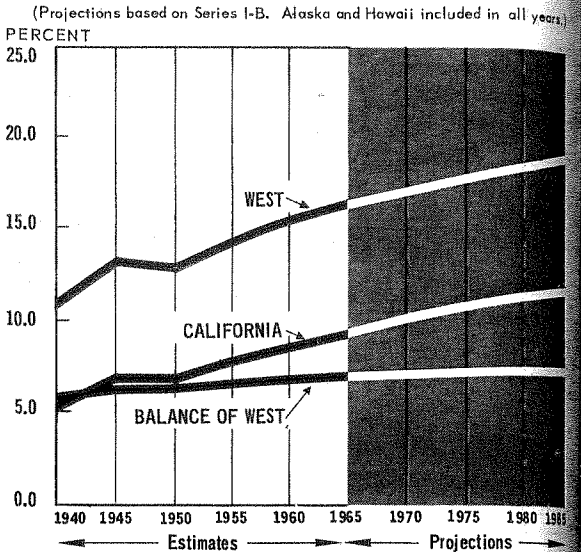

¹Source: Current Population Reports, Series P-25, Nos. 72, 304, and 348.

The projected values in figure 1 and table B are based on Series I-B, but the percentage distribution of population among the four regions is not greatly affected by the alternative assumptions of the four main series of projections. Under Series II-D, the West, for example, would be 19.0 percent of the Nation in 1985, compared with 19.4 percent under Series I-B.

States.—By 1985, California would still be the largest State according to these projections (table 1). Under Series I-B, California would gain 13 million during the period 1965-85, to reach a population of 31.7 million in 1985, well over New York's 23.3 million and well over the 20.0 million of all other Western

States combined.¹ The extent to which California dominates the projected regional growth of the West is illustrated by figure 2, showing California's past and projected population as a percent of the Nation, compared to the total for the remaining 11 Western States.

Figure 2. California and Balance of West as Percent of United States Population: 1940 to 1985

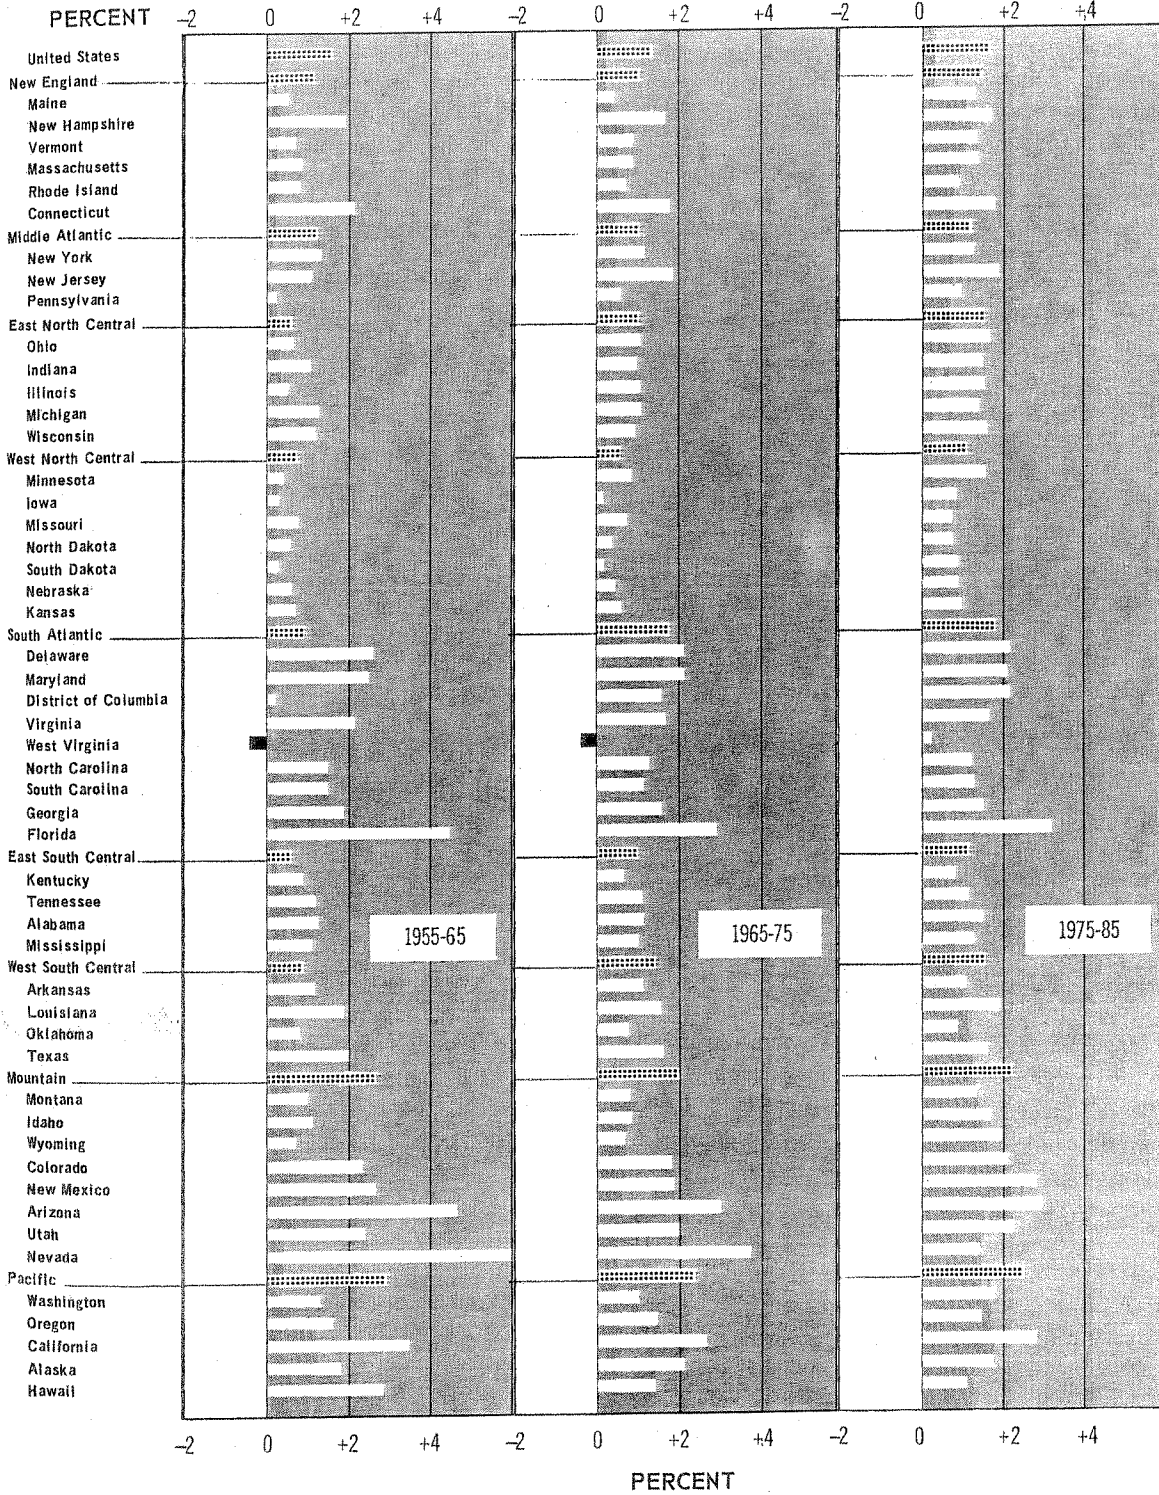

The highest percentage gain over the whole projection period (1965 to 1985) is shown by Florida, with a growth of 81.5 percent under Series I-B (table 2). For this series, Arizona is almost the same with 80.6 percent and only West Virginia is projected to lose population. (Only under Series II-B is West Virginia projected to gain population.)²

Average annual rates of population changes for each State for the period 1965-85 are presented in table 3 for all series. Figure 3 illustrates the average annual rates of change

¹The relationships among States under Series I-B discussed in this section generally hold for the other three main series, although the lower fertility assumptions of the D series result in significantly lower population levels.

²These indicated changes for West Virginia illustrate a fundamental characteristic of the projections, namely, that no explicit or implicit assumptions regarding the impact of proposed Government programs such as that for Appalachia have been introduced. The Appalachia program may well have a significant impact on future patterns of net migration for the area. Similar situations could exist for other areas where State or national undertakings may have an appreciable effect on population trends in the future.

Figure 3. Average Annual Rates of Growth (in percent) for States:
Selected Periods, 1955 to 1985 (Projections based on Series I-B)

under Series I-B for each 10-year period from 1955 to 1985. Rapidly growing States during the base period 1955-65,³ such as Nevada, Arizona, Florida, and California, are also among the leading growth States during the projection period.

The extent to which the State rates differ from the national average tends to decrease in the later periods because of the nature of the interstate migration assumptions and how they are applied in deriving net migration. Since out-migration was computed first as a rate for each State and in-migration distributed afterwards according to the State proportions of all interstate migrants observed during the 1955-60 period, a State growing rapidly from net in-migration tends to have its rate of net in-migration gradually decreased as its population base grows. By contrast, the slower growing States fare better relatively as time passes, since they retain a constant proportion of an in-migrant pool that grows as the total United States population grows, while their relative share of out-migrants is declining. Thus in figure 3, the States of Minnesota, Iowa, and others of their geographic division have rates of growth during the base period well below the national average, but the procedures used have the consequence of showing improvements in their position relative to other States during the projection period. As a result of these tendencies, the average annual rates of growth projected for the last 10-year period vary considerably less from the national average than do the rates for the base period, 1955-65.

Although State differences in birth and death rates account for some of the variation in growth rates among States as may be observed in figure 3, differences in net migration cause the more significant variation. Figure 4 (page 6) shows the States ranked by amount of net migration projected for the period 1965-85 for Series I-B. California leads by a wide margin, with a gain of 5.8 million net migrants, and Florida would have just under 3 million. Pennsylvania and Michigan show the heaviest amounts of out-migration.⁴

³Although the basic rates of gross migration were derived from the 1955-60 period, the estimated net interstate migration from 1960 to 1965 conditions the use of these rates in the projection period. See Methodology, page 13.

⁴Note that net immigration is projected over the period at 400,000 per year, a total of 8 million for 20 years. A substantial portion of this is assigned to California and New York. See appendix table A-5.

The States rank somewhat differently with respect to net migration rates defined as a percentage of the base population (1965) as shown in figure 5 (page 7). Here Florida, with a net migration rate of over 50 percent, leads by a wide margin, with California in second position followed closely by Arizona. A number of States show sizable rates of net out-migration, the heaviest being for West Virginia and Alaska.

Age composition.—Important shifts in the age structure of the national population are expected in the future as the result of past trends in birth rates. In 1965 the first wave of the postwar surge of births, which started in 1946, had just begun to enter the college-age group. As a consequence, this group will grow substantially more rapidly than other age groups in the next several years. Between 1965 and 1985, the most rapidly growing groups are expected to be those of college age (18 to 24) and those in young adulthood (25 to 34).

The changes in the pattern of births in the past 30 to 40 years will produce some imbalances in the supply of labor. By 1975, for example, there will be fewer persons 35 to 44 years of age, the age group which is perhaps the main reservoir for new, young, executive talent, than there are in the group at present. At the same time, a substantial supply of young labor force entrants will be forthcoming. Persons now 25 to 34 years of age represent the group born during the low birth-rate period of the 1930's. These people will be 35 to 44 years of age by 1975 and 45 to 54 years of age by 1985. Thus, the deficit in the 35 to 44 group in 1975 indicated earlier will shift to the 45- to 54 group in 1985. For the 35- to 54-year group as a whole, however, little change in total number is expected between now and 1975, but increases are expected by 1985. A detailed discussion of changes in the national age-sex structure of the population, particularly as related to the important functional age groups (school-age population, population in the main working ages, and the elderly) is given in Series P-25, No. 286, pages 4 to 10.⁵

State changes in age composition during the projection period will, to a large extent, parallel those at the national level, but with some important State variations taking place as a result of net interstate migration. The projected

⁵Although the national projections have been revised recently, and a new detailed report is expected to be published shortly, except for the very young ages, the pattern of age changes indicated in that report is not materially affected by the recent revision. See Series P-25, No. 359 for revised age data.

population by broad age groups and the corresponding rates of increase are shown in table 5. The heavy increase projected nationally for the college-age group and the younger working ages will generally prevail throughout the States. There are, however, large differences between the States growing rapidly and the slower growing States.

To illustrate this point, table C shows growth rates by broad age groups for three States whose total population would be growing more rapidly than the national average, and for three States growing less rapidly. The population 18 to 44 is projected to almost double by 1985 for the three rapidly growing States compared to a national rate of about 50 percent (Series I-B). Even the slower growing States would have an increased population in this age group, though at a much smaller rate. The picture is quite different for the 45-64 age group, with national growth expected to be only moderate at about 10 percent, and substantial losses for the slower growing States. For this age group, the difference between national and State rates of growth are extreme for Series I-B. For two of the rapidly growing States, Arizona and Florida, table C shows that the State rate is more than six times as great as the national rate. This is, of course, partly due to the projected net migration from 1965 to 1985 for the cohort aged 45 to 64 in 1985. However, a substantial portion of this State-national differential would be retained even under

the assumption of zero net interstate migration during the projection period as is indicated by Series III-B, also shown in table C. For the age group 45-64, a substantial differential from the national rate is still apparent for the rapidly growing States, especially Arizona.

This phenomenon is a function of the dissimilarity of these States' age distribution in 1965 from that of the Nation, caused primarily by the effects of past trends in net migration, migrants having been heavily concentrated in the younger ages. For example, about 40 percent of all interstate migrants during the period March 1962 to March 1963 were 18 to 34 years of age, and children under 13 accounted for another 33 percent. The heavy in-migration of the recent past to Arizona and other Western States has resulted in a much heavier concentration of their population in the younger ages. Thus, in 1960 Arizona had 26 percent of its population in the age group 25 to 44 (compared with 24 percent for Iowa, for example). For the population 45 to 64 in these States, the situation is reversed, with 18 percent of Arizona's population in this age group, compared with 20 percent for Iowa. In 1960 the ratio of the population 25 to 44 years old to the population 45 to 64 was 1.49 for Arizona as compared with 1.16 for Iowa. Differentials of this magnitude, when combined with the projected continuation of past migration patterns, result in the very different growth rates among States for the age group 45 to 64 shown in table C.

Table C.—PROJECTED PERCENT CHANGE IN POPULATION BY BROAD AGE GROUPS, FOR THE UNITED STATES AND SELECTED STATES: 1965 TO 1985

(Minus sign (-) denotes decrease)

State	Series I-B					Series III-B				
	All ages	Under 18 years	18 to 44 years	45 to 64 years	65 years and over	All ages	Under 18 years	18 to 44 years	45 to 64 years	65 years and over
States growing faster than the national average:										
Arizona.....	80.6	76.7	89.9	66.1	91.0	54.1	53.1	65.3	35.7	48.3
California.....	72.3	76.6	84.7	44.2	65.2	43.8	44.8	51.1	26.1	48.2
Florida.....	81.5	83.5	92.3	64.3	73.0	34.2	41.1	49.0	16.4	1.8
United States.....	36.0	36.1	50.8	10.0	37.6	36.0	36.1	50.8	10.0	37.9
States growing more slowly than the national average:										
Iowa.....	11.6	9.0	33.6	-12.7	4.7	27.7	27.2	55.9	-2.1	8.5
Pennsylvania.....	15.3	13.6	27.7	-7.2	29.9	24.6	22.8	39.7	-1.7	39.8
West Virginia.....	-0.3	-8.0	11.4	-15.4	21.2	26.9	21.7	48.5	-1.0	34.6

Figure 4. States Ranked by Amount of Net Migration: 1965 to 1985

(Projections based on Series I-B)

Figure 5. States Ranked by Net Migration Rate: 1965 to 1985

(Series I-B--net migration as percent of 1965 population)

The concentration of population in the age group 18 to 44 in these States also results in a higher crude birth rate, assuming fertility rates to be equal. Thus the population under 18, which by 1985 will be made up entirely of persons born between now and 1985, also is projected to grow much more rapidly in Arizona, California, and Florida than in the States whose total population is growing more slowly, even under the assumption of no net migration during the projection period.

The significant role played by net interstate migration in determining future population distribution and composition and the uncertainty of the volume and direction of such migration certainly preclude any precise statement as to the amount of change forthcoming for each of the States. The size of the State-national differentials indicated by the projections suggests, however, that appreciable differences in growth rates by age among the States will occur even if future net migration deviates considerably from the projected patterns.

METHODOLOGY

General.—The methodology and underlying assumptions used to develop these State projections are similar to those used in developing the earlier State projections published in report No. 326. Each of the components of population change—births, deaths, and interstate and international migration—was projected separately. A single set of projected mortality rates was used for all States, but alternative assumptions relating to national fertility and interstate migration were introduced in order to provide a reasonable range of projected population for each State. A fundamental characteristic of the projections is the separate computation of gross out- and in-migration to derive net migration, as opposed to the more common practice of working directly with net migration.

Basically, the projections start with the estimates of the total population of States for July 1, 1965, published in report No. 348 of this series. Since the 1965 State figures were not available by detailed age-sex-color groups, operationally, the computations start with the April 1, 1960, Census data for each State, by age, sex, and color, and are carried forward to 1965 on the basis of separate projections of each of the components of change, also by age, sex, and color. At this point, the projections are forced into agreement with the estimates of the population of States, by broad age groups, for July 1, 1965, given in report No. 354. The adjusted projections for July 1, 1965 (which are now consistent with the current estimates) are then

carried forward by 5-year periods to each projection date on the basis of the assumptions chosen concerning future births, deaths, and migration.

All told, four main series of projections are shown—that is, two assumptions concerning future interstate migration combined with two levels of fertility, labelled Series I-B, I-D, II-B, and II-D. The Roman numerals relate to the migration assumption; the letters designate the national fertility series incorporated in the projections. The underlying assumptions for each series can be broadly summarized as follows:

Series	Interstate migration assumption	National fertility assumption
I-B.....	Migration rates will continue within the range observed in 1955-60 and 1960-65.	Moderate increase from present levels.
I-D.....	Same as I-B	Continued decline from present levels.
II-B.....	Migration rates will change from recent levels so as to result in no net migration among States in 50 years.	Same as I-B
II-D.....	Same as II-B	Same as I-D

The methods and assumptions used to derive the various projection series are described below.

Projections of births.—Even at the national level, the number of births for future years cannot be projected with a high degree of certainty. Because of the wide range of reasonable possibilities in the future course of fertility, the national population projections report (Series P-25, No. 359), includes a number of alternative fertility levels based on different assumptions. Four principal series were developed to describe the future course of fertility. In the projection of births for a given State for future years, the elements of uncertainty existing at the national level still prevail; nonetheless, in terms of overall fertility, the factors determining changes in future national fertility are not believed to have an appreciable impact on the fertility differentials already existing among the States. Consequently, the approach here for State projections of fertility is not one of determining the future course of fertility in each specific State, but, rather, of distributing the previously projected

national number of births to the State on the basis of some reasonable criteria. The main elements used to distribute the national projections of the number of births are: (a) the size of the female population of each State in the childbearing ages, and (b) each State's recent level of overall fertility (births per 1,000 women 15 to 44 years old) in relation to national levels.

For present purposes, two of the national series of fertility projections, Series B and Series D, were chosen. Fertility rates (defined here as the number of births per 1,000 women in the ages 15 to 44 years) for each State were computed for a 3-year period centered on April 1, 1960. The corresponding national rate for that period was also computed. Using the 1960 relationship of the State rates to the national rates (referred to hereafter as the State-national ratios) as starting points, it was assumed that the State-national ratios would reach unity in 50 years. It is assumed, in effect, that the factors producing State differences in fertility will gradually disappear and that, in approximately 50 years, the fertility rates for all States will be equal to the national rate.

The State-national ratios for the years intermediate between 1960 and 2010 were obtained by linear interpolation. State fertility rates for each projection period, 1960-65 to 1980-85, were derived by applying the projected State-national ratios to the previously computed national fertility rates for these periods (Series B and Series D, separately). These projected fertility rates for States, multiplied by the projected number of females 15 to 44 years of age, yield projections of the number of births for each State for each period. The projected number of females 15 to 44 years old for each State had been derived as part of another stage of the projections, by carrying forward the 1960 population using age-specific mortality and gross interstate migration rates. Births projected for each State for each 5-year period were then summed, and adjusted to add to total births from the national projections, Series P-25, No. 359. The computations described were carried through for the white and nonwhite population separately.

The national fertility rates by color used here as bases in computing the State rates are shown in table D.

Table D.--PROJECTED FERTILITY RATES, BY COLOR: 1960-65 TO 1980-85
(Average annual number of births per 1,000 females 15 to 44 years of age,
for middate of each period)

Period	Series B			Series D		
	All classes	White	Nonwhite	All classes	White	Nonwhite
1960-65.....	111.5	106.0	151.9	111.5	106.0	151.9
1965-70.....	100.4	95.2	136.5	88.4	84.2	118.2
1970-75.....	111.3	105.9	147.5	83.6	80.1	107.1
1975-80.....	115.4	109.9	150.7	85.4	82.2	106.4
1980-85.....	113.9	108.5	147.5	86.4	84.3	106.2

Projections of deaths.—One set of age-sex-color-specific mortality rates was used for all States for all series in the projections. The projected rates are consistent with those developed for and used in the new national population projections presented in Series P-25, No. 359. Rates for each 5-year projection period were obtained by linear interpolation between the rates by age, sex, and color observed in 1962, and those projected for the period 2000-2005, also by age, sex, and color, for the national projections. To assure exact agreement between these projections and the new national projections, the projected numbers of deaths for States for each 5-year period were summed and adjusted to agree with the number of deaths developed in the national projections also by age,

sex, and color. The rates for the period 2000-2005 are consistent with the "high" mortality rates for the year 2000 developed in 1957 by the Social Security Administration.⁶ For a general discussion of the underlying logic behind the mortality assumptions, see report No. 359; report No. 286, the previous detailed report of national projections, contains a more detailed discussion which is still generally applicable. The detailed national report to follow No. 359 is still in process and will be published in the near future.

⁶Social Security Administration, Illustrative United States Population Projections, by T.N.E. Greville, Actuarial Study No. 46, May 1957.

The use of only one set of age-sex-color-specific mortality rates is not intended to deny that State differences in mortality exist. It is believed, however, that allowing for the actual State differences in mortality would have very little impact on the present population projections.

Projections of migration

1. General.—Interstate migration was projected by treating gross out- and gross in-migration separately, with net migration obtained as the difference between these components. (Separate computations were made for net immigration from abroad.) This is the same procedure used in the previous set of State projections published in Series P-25, No. 326. The more conventional approach is to project rates of net migration. The use of gross migration data is more logical in that at the outset total interstate in-migration is dependent upon and equal to total interstate out-migration; by contrast, the use of net migration rates quite often results in serious imbalances between total net in-migration and net out-migration, which are difficult to resolve.

The conventional procedure in using net migration rates for projections is to assume the continuation of past trends, and to multiply the projected rates by the population at the beginning of each projection period to determine the amount of projected net migration. Under these conditions the in-migration States automatically receive larger and larger numbers of in-migrants, while the remaining States are forced to provide unreasonable numbers of out-migrants, since the base population in the latter States becomes a smaller and smaller proportion of the national population as a result of out-migration. Thus the sums of net in-migration and net out-migration become seriously unbalanced, and the computed net migrations require progressively larger adjustments to balance them out to zero (or to a national control total representing net immigration from abroad).

These considerations suggested the use of gross migration rates. Pertinent migration statistics are available by States for only three periods, the most recent being the 1955-60 period. In the 1960 Census, a specific question was asked concerning the State of residence in 1955, thus providing information for all States on surviving in-migrants and out-migrants, by age, sex, and color.

In this report the rates of gross out-migration observed during the 1955-60 period (by 5-year age groups, sex, and color) were multiplied by

the population at the beginning of each quinquennial period to determine the total number of out-migrants for each State for each 5-year period. These were summed to obtain a national total for each 5-year period, and then allocated to the States as in-migrants (again by age, sex, and color) according to the proportion of national interstate in-migration each State received during the 1955-60 period. Under this procedure, the sum total of net interstate migration for all States is zero. The difference between a State's contribution to the gross number of out-migrants and the number it receives as in-migrants represents net interstate migration for the State.

Unlike assumptions of continuing net migration rates, this procedure avoids automatic increases in the number of net migrants of gaining States. As the population base of a State grows in any age-sex-color group, it contributes more persons to the migration pool. The number of in-migrants it receives, however, represents a constant proportion of migration pool and is unaffected, or affected very little, by the changing size of its population. As its out-migration share grows, its net migration tends to become smaller.

The overall annual gross migration rate implied by the projections is relatively constant at about 3.3 percent throughout the projection period, consistent with the general stability of this rate as observed annually over the past 17 years in the Current Population Survey.⁷ The consistency of this rate during the projection period is to be expected for Series I—discussed in paragraph 2 below—since this series assumes a continuation of the age-sex-color migration rates of the recent past. Even, however, under Series II—discussed in paragraph 3 below—where the state migration rates are assumed to change, the overall interstate migration rate remains similar to that of Series I.

2. Migration Series I.—For this series the computation of gross migration described above is carried out by age, sex, and color assuming that the gross out-migration rates and the in-migration distributions of the 1955-60 period will remain constant throughout the projection period. However, an adjustment is introduced (see paragraph 5b below) to allow for net migration observed during the period 1960-65 as reflected in current estimates of State population.

3. Migration Series II.—In Series II, it is assumed that the gross out-migration rates will converge toward national levels. At the same

⁷Current Population Reports, Series P-20, No. 156.

time it is assumed that the in-migration distribution will converge toward the State population distribution. In effect, then, whereas Series I holds the 1955-1960 rates constant, Series II assumes a trend in the rates. In seeking an alternative assumption, consideration was given to the possible ways in which out-migration rates and in-migration distributions could be modified. In reviewing the various possibilities, it was concluded from the historical evidence, as indicated earlier, that there is little prospect that the national rate of interstate migration will disappear in the future. Some equilibrium in net migration may be reached, however, if economic opportunities and other social and economic differentials among the States tend toward equality.

Thus, the assumption adopted for Series II is that State migration differentials will gradually be reduced, and that at some point in time (approximately 50 years), the number of persons migrating from a State will be offset by an equal number of persons moving into the State, thus providing zero net migration for each State. This alternative migration assumption requires some change from current gross migration rates during the projection period.

To achieve this equilibrium of migration, it was assumed that at the terminal point, 50 years hence, the total number of out-migrants and in-migrants will each be distributed in proportion to the population of the States. Thus, a State with 10 percent of the population of the country will contribute 10 percent of the total interstate migration pool (out-migrants) and receive in turn, 10 percent of the migration pool as in-migrants.

Operationally, the rates for Series II were obtained by interpolating between (1) the 1955-60 out-migration rates by age, sex, and color for each State; and (2) national interstate rates by age, sex, and color, so that by the period 2005-2010, the out-migration rates for all States are equal to the national averages. Interpolated values for intervening periods are then a function of time. For example, convergence becomes halfway complete in half the time, in other words after 25 years.

Symbolically, the series for a specific age-sex-color group is derived as follows:

M_i = out-migration rates in State i

P_i = population at beginning of period in State i

ΣP_i = total population of the United States (sum of States) at beginning of period

$M_i P_i$ = number of out-migrants from State i during specific quinquennium.

Then:

$\Sigma M_i P_i$ = sum of out-migrants from all States for specific period

$\frac{\Sigma M_i P_i}{\Sigma P_i}$ = national interstate migration rate for period.

The assumption under Series II is that in 50 years, for each State,

$$\frac{M_i P_i}{\Sigma M_i P_i \Sigma P_i} = \frac{P_i}{\Sigma P_i}$$

$$\text{Thus, } M_i = \frac{\Sigma M_i P_i}{\Sigma P_i}$$

For any given 5-year period, the out-migration rate is derived from $k(M_i) + (1 - k) \frac{\Sigma M_i P_i}{\Sigma P_i}$,

where k is computed proportionate to time. To illustrate, for the 1960-65 period, (k) equals 0.95; in 1980-85, (k) equals 0.55. Thus, by the year 2010, (k) equals 0 and the State out-migration rate is equal to the national rate.⁸

Similar computations were carried through for the in-migration distributions; that is, for each period of time, the interpolation was made between the percentage of in-migrants that a State received in the 1955-60 period and the percentage of migrants it would receive proportionate to its population. Here, too, the interpolations were made proportionate to time, so that in 50 years the percentage it would receive as in-migrants from the interstate migration pool would be the same as its share of the national population.

Migration assumption II, as compared to assumption I, has a more moderating effect on the projected redistribution of population. States growing well above the national average are slowed down in their rates of growth as gains through migration exchanges with other States are reduced. Correspondingly, States with heavy out-migration begin to receive migrants at a faster pace because of reduction in their contribution of out-migrants and of increases in their share of in-migrants. Although under migration assumption I such changes in population redistribution also occur, the effect under Series II is substantially greater. Table E illustrates this effect for three States, one projected to have net in-migration, one with moderate net out-migration, and one with above-average net out-migration.

⁸ $k(M_i) + (1 - k) \frac{\Sigma M_i P_i}{\Sigma P_i} = \frac{\Sigma M_i P_i}{\Sigma P_i}$ when $k = 0$.

Table E.—RATE OF TOTAL NET MIGRATION (IN PERCENT) FOR SELECTED STATES: 1955-65, 1965-75, 1975-85

State	Estimated, 1955-65	Projected			
		Series I-B		Series II-B	
		1965-75	1975-85	1965-75	1975-85
Colorado.....	+8.28	+4.46	+3.16	+4.05	+2.70
Alabama.....	-2.79	-2.24	-1.58	-1.89	-0.96
North Dakota.....	-11.22	-9.51	-7.68	-7.98	-5.23

4. Net immigration from abroad.—Net immigration was allocated to the States separately, using as an overall total the level established for the national population projections—that is 400,000 per year. The distribution to States is made on the basis of the 1960 State of residence of the foreign-born population reported in the 1960 Census as living abroad in 1955. The amount of net immigration allocated to each State for each 5-year period after July 1965 is shown in appendix table A-5.

5. Adjustment of migration rates.—As stated, data from the 1960 Census on interstate migration of the 1955-60 period were used to derive estimates of migration for the projection period. The gross migration rates of the 1955-60 period, however, were modified in two important respects, as follows:

a. Adjustment for military movement.—The basic 1955-60 migration data include both civilian and military interstate migration. Because the migration rates around military ages are unusually high and States with large military installations gain migrants at the expense of States with little or no military personnel, an assumption of the continuation of such migration rates for an extended period leads to unreasonable results in some instances. Specifically, the number of males becomes increasingly larger (compared to the number of females) in those States with the large military installations. Such results are inconsistent with the assumption underlying the basic projections, that is, the assumption of no significant changes in the size and distribution of the Armed Forces in the United States over the projection period.

In order to reduce the impact of such movements, the migration data have been modified to exclude, to as large an extent as possible, gross movements of military personnel. In effect, the 1955-60 rates were modified to reflect only civilian migration, with estimates of the Armed Forces movements being handled separately in the pro-

cedure.⁹ Although this procedure had, in general, little impact on the overall total population of States, it does have significant impact on the age composition of males, particularly around the military ages, in those States with large military installations. Although the conversion of the migration rates of the total population to the civilian population is somewhat imperfect because of the lack of necessary information required to make such adjustments, it is believed that the modification significantly improved the projections for those ages and States where such adjustments were important. Because the age group 18 to 24 years is particularly affected by this adjustment and because migration rates are very high for this group, the projected values should be interpreted with caution.

b. Adjustments for net migration, 1960 to 1965.—It was also necessary to adjust the 1955-60 rates in order to take account of population changes, mainly due to net migration, that have occurred since 1960. The resulting adjustment applies with equal effect to both migration Series I and II. The latest current population estimates by age available at the time these projections were undertaken were those for 1965 published in report No. 354 of this series. Estimates of net migration by age consistent with the 1965

⁹It was assumed that the size of the Armed Forces, at home and abroad, would remain constant at approximately the 1966 level. Persons entering the Armed Forces were distributed, by age, to States of preservice residence on the basis of the 1966 State population distribution. They were assigned to the State of their duty station using the 1966 State of station distribution of the Armed Forces. This procedure leads to a net movement of zero for each State between military and civilian population, as assumed in the projections. Within each State, however, there is substantial differential movement by age since most entries into the Armed Forces occur at ages 18 to 24 years and most returns to civilian life occur at later ages.

population estimates were developed for the period 1960-65. The 1955-60 gross migration rates were adjusted in such a manner that, when used for the period 1960-65, they produced estimates of net migration by age for each State about the same as that derived from the independent current estimates.

The adjustment was accomplished by first computing "projections" of net interstate migration for the 1960-65 period using the 1955-60 migration rates and then comparing these estimates with the independent current estimates for the 1960-65 period. The difference between the initial "projections" of net migration for 1960-1965 for each State, and the net migration developed consistent with the current estimates for 1960-65 was then used to adjust the 1955-60 out-migration rates and the distribution of in-migrants. The amount of adjustment assigned to each flow, for each age-sex-color group, was determined by the ratios of gross out- and gross in-migrants, respectively, to their sum. A second computation beginning with April 1, 1960, using the 1955-60 rates as adjusted, now yielded figures which closely approximated the 1965 independent current estimates.

Part of the adjustment was retained during the projection period, thus assigning weight to the 1960-65 migration experience in the subsequent derivation of the projections. From 1965 to 1970, three-quarters of the adjustment was used; from 1970 to 1975, one-half; and for the period 1975-80, one-quarter. From 1980 to 1985, the original 1955-60 values were employed. In effect, then, for the bulk of the projection period, the migration assumptions represent a blending of the 1955-60 gross migration experience with the more recent 1960-65 net migration estimates. This procedure yields projections which can be generally described as "based on the assumption that recent migration rates would prevail during the projection period." This system of combining the migration experience of the two most recent periods recognizes, and takes advantage of, the large amount of detailed data available from the census for the 1955-60 period, while broadening the base period of the migration projections. The difference between this procedure and that used in report No. 326 is discussed below under "Comparison with earlier projections."

OTHER SERIES

The projections described above result in four main series—that is, two assumptions concerning future interstate migration combined with two

levels of fertility (labelled Series I-B, I-D, II-B, and II-D). Detailed tables I through 9 relate to these four series. A number of other series based on alternative interstate migration assumptions were developed to provide background data for selecting the projection series to be used for specific projects. These series are given in the appendix tables.

One alternative series, designated as Series III, assumes "no net migration" for each State during the projection period. In this series, it has been assumed that, regardless of gross population movement, net interstate migration for each State in each period after 1965 will balance out to zero (for each age-sex-color group as well as for the total). This series is useful for measuring the impact on the population projections of alternative assumptions of future interstate migration. Net immigration from abroad at the rate of 400,000 per year is assumed to continue for this series.

Another alternative set of projections affects only the nonwhite population in States. Generally speaking, the rates and pattern of nonwhite migration differ to an appreciable degree from those of the white population. This alternative projection series has been derived to illustrate the effect of interstate migration on the population distribution of the nonwhite population if interstate migration rates for whites and nonwhites should become equal. For this series, it was assumed that for each State, the nonwhite out-migration rates of the 1955-60 period will converge toward those of the white population, so that 50 years hence, the out-migration rates of the nonwhites, State by State, would be equal to those of the whites. It was further assumed that the distribution by State of destination would, in 50 years, also be the same as for the white population. The projection of the nonwhite population resulting from this procedure is given in appendix table A-6 for 23 States with a nonwhite population in 1960 of 250,000 or more.

A special set of projections was also derived for the District of Columbia. The District of Columbia is a small area and exclusively urban. Its population composition, the city's position as the core of a large metropolitan area, and past suburbanization, which has involved substantial interstate movement, all contribute to unusual gross interstate migration patterns. Furthermore, it is quite possible, because of present and planned land use, that the current population is not very far below the practical maximum. Consequently, migration assumptions I and II may not be at all appropriate for this area.

In recognition of these special circumstances, two supplementary projections were derived for the District of Columbia, which result in substantially lower figures for 1985 than those derived by the uniform assumptions as shown in the detailed tables. These alternative projections are based on somewhat different combinations of projections by color from those used in the main series. A projection of 866,000 in 1985 (Series X) results from an assumption of no further net out-migration of white persons and the convergence of the 1955-60 gross migration rates for nonwhite persons toward those for whites for that period. This series, in effect, allows for considerable net out-migration of the nonwhites from the District of Columbia. An alternate projection of 948,000 in 1985 (Series Y), on the other hand, assumes the continuation of the net out-migration of whites from the District, but at rates reduced somewhat from those of the recent past period, and for a somewhat slower convergence of the gross migration rates of nonwhites to those for the whites than that assumed for Series X. Projections by age for the District of Columbia for 1975 and 1985 under these special assumptions are shown in appendix table A-7.

In contrast to these projections for the District of Columbia, recent local reports for the national capital area suggest that a population of 950,000 should be accommodated by 1985.¹⁰

Projections available from other sources.—The projections given here are based on the specific methods and assumptions described above. Alternative methods and assumptions, also reasonable and logical in approach, could have been used, and might have yielded substantially different results. In fact, there have been reports by other organizations which present population projections for all States. For example, two reports in which the methods differ substantially from those used here may be of particular interest to persons concerned with the impact of alternative procedures on projections. The two reports are:

“State Population, Net Migration, Labor Force and Industry Employment Trends to 1975,” Regional Economic Projections Series - Report No. 65-1, prepared by the Center for Economic Projections, National Planning Association, Washington, D.C., March 1965.

Basic Economic Projections, United States Population, 1965-1980 by Pietro Balestra and N. Koteswara Rao, Stanford Research Institute, Menlo Park, California, 1964.

Population projections for individual States are also often available from State and local sources.¹¹ The methodology of some of these projections parallels in some respects the methodology described here; others are quite different in their approach, attempting to assess the economic potential of particular areas, or perhaps reflecting specific economic development plans.

COMPARISON WITH EARLIER PROJECTIONS

As mentioned above, the basic procedure and assumptions for this report are similar to those used in report No. 326 of this series. The indicated populations of the new projections differ considerably in some cases from the older ones, however, owing to several factors. Table F shows the amount and percent of difference between the two reports for the Series I-B projections for 1985. The differences shown in table F arise from four factors:

1. The projections in this report are tied in with national totals by age, color, and sex published in Current Population Reports, Series P-25, No. 359; for the earlier projections, the national totals from report No. 286 were used. The new national projections for 1985 are somewhat lower than those in report No. 286 because of the lowered level of projected births for the period 1965-85, especially for Series D. These changes reduced the Series B projections for 1985 by about 2 million, and the Series D projections by about 6.5 million.

2. Revised State estimates as of July 1, 1965, were the starting point for these projections as compared with provisional estimates as of July 1, 1964, in the previous set.

3. Substantially more weight is given here to the current estimates of net migration for the period since 1960 than in the earlier report. In that report, one-half of the adjustment to the 1955-60 rates of gross migration needed to force the “projection” from April 1, 1960, to July 1, 1965, to agree with the 1965 State estimates was retained for the period 1965-70. From 1970 to 1985, no adjustment was applied to the 1955-60 rates. For this report, however, adjustments were retained up to 1980 before the rates reverted entirely to the 1955-60 gross migration rates.

¹⁰The Proposed Comprehensive Plan for the National Capital, National Capital Planning Commission, Washington, D.C., February 1967.

¹¹A bibliography of recently published State and local population projections is available from: Chief, Population Division, U.S. Bureau of the Census.

4. The adjustments referred to in item 3 above were computed separately for the broad age groups for which 1965 estimates have been published. This elaboration of the adjustment procedure has only a minimal effect on total population but assures consistency between the projections and the 1965 estimates by age.

These factors, in general, had a moderate effect on the results, with the projections for nine States differing from the earlier set by more than five percent (Series I-B). The new projections for Nevada, however, are substan-

tially higher than those published last year and only part of the increase can be attributed to the factors mentioned. Nevada received an additional adjustment to allow for the fact that its population growth due to net migration in the current decade is far surpassing that of the 1955-60 period. The additional modification in the procedure introduced for Nevada gives more weight during the projection period to the 1960-65 net migration experience than is the case for the other States. About one-third of the difference shown in table F is due to this special adjustment.

LIMITATIONS OF THE DATA

As already mentioned, these projections should not be regarded as predictions but rather as indications of the population distributions which would develop on the basis of the assumptions which were selected, regarding fertility, mortality, and migration. Separate projections are made of each of these components, and alternative assumptions provide reasonable ranges of fertility and migration for illustrative purposes. It is not claimed, however, that these assumptions will necessarily demarcate the range within which either of these variables will fall.

The component method was chosen for these projections on the basis of a number of methodological considerations, rather than on the basis of the relative accuracy of the various methods in the past. The component method, as contrasted with, for example, the ratio method, takes advantage of the fact that some of the components are likely to change relatively little. This seems to be the situation with respect to survival rates. More direct use can be made of national projections of mortality, fertility, and net immigration from abroad. However, the choice of method is not as important as the choice of the assumptions relating to each of the components.¹² In the case of interstate migration (the component with the highest degree of uncertainty in State projections), the choice of assumptions was dictated by the reasonableness and logic of the underlying hypotheses, by the desire to make maximum use of the detailed data on interstate migration from the 1960 Census, and by the fact that the assumptions chosen can be applied uniformly to all States.

Since the projections are, by nature, based on past trends and rates of net migration are often high, a shift in the future away from the levels of the base period can result in considerable variation from the projected figure in the short-term as well as in the long-run. The separate treatment of gross out- and in-migration in these projections, although advantageous in many ways, cannot prevent this source of error. Also States with low rates of net migration, plus or minus, not infrequently shift the direction of net

¹²An evaluation of the relative accuracy of past projections of States is described in Helen R. White, "Empirical Study of the Accuracy of Selected Methods of Projecting State Population," *Journal of the American Statistical Association*, Vol. 49, No. 267, September 1954, pp. 480-499.

flow every few years, or even from year to year, at least according to the imperfect measures now available for estimating net migration for States. Thus, any system which makes projections on the basis of past levels and assumed trends, whether of migration or of economic variables such as immigration, will obviously fail to predict a shift away from these trends during the projection period or even fluctuations about then.

Interstate movements of military personnel present a special problem in using migration data for males of military age. A minimum adjustment has been introduced to allow for some of this interstate movement, and it is believed to have improved the projections of total population for States with large military installations. However, projected population in the younger military ages for these States should be interpreted with caution.

It is generally believed that interstate migration movements are significantly affected by differential economic opportunity and that any drastic changes in the economic advantages of one State over another will have substantial impact on the future size of migration streams and even on the direction of the net movement. Nonetheless, no explicit assumptions relating to this factor have been introduced. Considerable research by both public and private organizations is being directed toward these relationships,¹³ and future projections may introduce explicit assumptions in this regard.

Future developments in fertility may also cause a departure from the projected population figure. At the national level, the difficulty of anticipating future trends led to the use of four alternative assumptions for the U.S. population projections in Series P-25, No. 359, by which these State projections are controlled. To simplify the use of the State projections, only two of these assumptions, Series B and Series D, have been used, and future national developments could well fall outside the range of these two series. The absolute level of population, especially in the long run, could vary considerably because of this factor, but the problem is less acute as regards the impact

¹³Ira S. Lowry, *Migration and Metropolitan Growth: Two Analytical Models*, Institute of Government and Public Affairs, University of California, Los Angeles, California, 1966; and Cicely Blanco, *The Determinants of Regional Factor Mobility*, doctoral thesis, Nederlandsche Economische Hoogeschool te Rotterdam, 1962 (privately printed).

on the relative size of States, since changes in the general level of fertility will very probably affect all States in the same direction. Moreover, variations in future fertility are not expected to cause as great a departure from the projected figure as may be the case with interstate migration.

The use of only one projected set of mortality rates does not imply certainty as to the future course of this component, but rather that future developments are not expected to affect the projections to as great a degree as the other two components. The use of one assumption avoids proliferation of projection series and allows greater attention by the user to the assumptions regarding migration and fertility.

The projections are predicated on the general assumption that there will be no major war, severe economic depression, or other similar catastrophe. It is further implicitly assumed that the approximate level and pattern of defense spending during the base period 1955-65 will continue, since no attempt was made to assess the possible regional impact of substantial change in defense expenditures. The possible impact on

migration trends of defense developments resulting from American involvement in Viet-Nam, for example, is not explicitly or implicitly taken into account. No attempt has been made either to adjust for the expected impact of such specialized regional programs as that for Appalachia, or any other regional development plans still forthcoming.

RELATED REPORTS

The projections given here are consistent with the national population projections given in Current Population Reports, Series P-25, No. 359. They are also consistent with current estimates of the population of States for July 1, 1965, as published in Series P-25, No. 348, and corresponding State estimates by age in report No. 354.

The projections are generally consistent with national projections of school enrollment as published in Series P-25, No. 365, and of households and families in report No. 360. A summary report which brings together the available national and State projections and reviews the relationships among the various series is being prepared and will appear shortly.
