## MARKET ABSORPTION OF APARTMENTS ANNUAL

H-130-72-5
issued August 1973
Absorption Rates by Rent Classes, Apartments Completed

For sale by the Publication Services Division, Social and Economic Statistics Administration, Washington, D.C. 20233. Price 50 cents Quarterly, 25 cents.
U.S. DEPARTMENT OF COMMERCE

Social and Economic Statistics Administration bureau of the census
U.S. DEPARTMENT

OF HOUSING AND URBAN DEVELOPMENT

During 1971, completions of privately financed, nonsubsidized, and unfurnished apartments in buildings of 5 or more units amounted to 333,027 . Of these, 68 percent were rented within the first 3 months of completion, 85 percent were rented within 6 months, and 95 percent within 12 months.

One-half of these new apartments had 2 bedrooms, 43 percent had less than 2 , and 7 percent had 3 or more bedrooms. Monthly rents for 47 percent of the new units were in the $\$ 150$ to $\$ 199$ range, 37 percent were renting for $\$ 200$ or more monthly, and 16 percent had rents of less than $\$ 150$. Seven out of 10 (71 percent) included swimming pools in rental payments, and about half (56 percent) included air conditioning at no extra cost.

The absorption rates for apartments completed within three inonths declined as the rents went up. Of the apartments renting for less than $\$ 125$, approximately 87 percent were rented within 3 months, while those renting for $\$ 250$ or more had an absorption rate of 60 percent within the same period. The absorption rates for the lower-priced units remained higher than for the more expensive units for longer periods of market exposure.

The majority (92 percent) of these apartments were constructed inside standard metropolitan statistical areas, with 59 percent located outside central cities. Regional differences were apparent. Thirty-eight percent of these units were built in the South, with a 3 -month absorption rate of 65 percent., compared to the Northeast region in which 11 percent were built with three-fourths rented within 3 months.

The data are based on a sample survey and consequently the figures cited above are subject to sampling variability. Sampling errors for the figures that follow are indicated in parenthesis. ${ }^{1}$ These standard errors imply there are about 2 chances out of 3 that a complete count would be contained in the interval around the estimate defined by the standard exror.

Throughout all of 1971 a total of 581,000 $( \pm 18,300)$ privately financed apartments were completed, of which 57 percent ( $\pm 1.1$ percentage points) were included in this survey. The remainder are cooperatives and condominiums, 8 percent ( $\pm .7$ percentage points), and furnished rental units, 6 percent ( $\pm .6$ percentage points). Excluded from the survey are units in federally subsidized properties, 18 percent $( \pm 9$ percentage

[^0]points), built under these programs of the Department of Housing and Urban Development: Senior Citizens Housing direct loans (Section 202), FHA below-market interest rate mortgages (Section 221 EMIR), FHA interest supplements on rental mortgages (Section 236) and all units in buildings containing apartments in the FHA rent supplement program. However, the data include privately owned housing, subsidized by State and local governments. In addition, 11 percent ( $\pm 7$ percentage points) are excluded for other reasons including turnkey housing (privately built and sold to local public housing authorities subsequent to completion).

Data comparable to that contained in this report for 1969 and 1970 completions are available upon request to the Office of Economic Analysis, Department of Housing and Urban Development, 451 Seventh Street, S.W., Washington, D.C., 20410.

## Sample Design

The Market Absorption Survey is designed to provide data concerning the rate at which apartments in buildings with five or more units are rented (or absorbed). In addition, data on characteristics of the units such as rent and number of bedroms are collected.

In each quarter of calendar 1971 a sample of about 1200 buildings with five or more units completed during that quarter was selected. The sample was selected from buildings reported as completed in a sample of building permits in the Census Bureau's Housings Starts Survey. ${ }^{2}$ Buildings completed in non-permit issuing areas are excluded from consideration in this survey.

The units in the buildings selected in a given quarter were interviewed in each of the next four quarters to collect data on the proportion and characteristics of units absorbed three, six, nine, and twelve months after completion.

## Estimation

The estimation procedure used in the survey involves, as a final step, the inflation of the weighted sample results to the quarterly estimates of housing completions obtained from the Housing Completion Survey. As the Housing Completion Survey is based on a larger sample it provides a more stable set of controls for estimates which can be obtained from both surveys. In addition

[^1]to reducing the sampling variability on the estimates of totals from the Market Absorption Survey, the ratio estimation procedure, as a useful byproduct, produces estimates of the units completed in a given quarter whichare consistent with the published figures from the Housing Completions series.

The absorption rates, if interpreted to represent all housing units in five or more unit buildings occupied for the first time during the survey period, must include the assumption that the absorption rates of units not interviewed or not accounted for are identical to the rates for units where data were obtained. The noninterviewed and not-accounted-for cases comprise less than 2 percent of the sample housing units in this survey.

## Reliability of Estimates

As the data in this report are based on a sample, they will differ somewhat from the results that would have been obtained from a complete enumeration of all units in five or more unit buildings completed during 1971. As in any survey work, the results are subject to errors of response and of reporting as well as being subject to sampling variability.

The standard error is primarily a measure of sampling variability, that is, of the variations that occur by chance because a sample rather than the whole of the population is surveyed. As calculated for this report, the standard errors also partially measure the effect of response and enumeration errors but do not measure any systematic biases in the data. The chances are about 68 out of 100 that an estimate from the sample would differ from a complete census figure by less than one standard error. The chances are about 95 out of 100 that the difference would be less than twice the standard error.

The figures presented in tables $A$ and $B$ are approximations to the standard errors of various estimates shown in the report. In order to derive standard errors that would be applicable to a wide variety of items and could be prepared at a moderate cost, a number of approximations were required. As a result, the tables of standard errors provide an indication of the order of magnitude of the standard errors rather than the precise standard error for any specific item.

The reliability of an estimated absorption rate (i.e., a percentage) computed by using sample
data for both the numerator and the denominator, depends upon both the size of the rate and the size of the total upon which the rate is based. Estimated rates of this kind are relatively more reliable than the corresponding estimates of the numerators of the rate, particularly if the rates are 50 percent or more. Table B contains the standard errors of the estimated rates.

## Illustrative Use of the Table of Standard Errors

Table 1 of this report shows that 72,466 units completed in 1971 rented for $\$ 150-\$ 174$. Table A shows the standard error of an estimate of this size to be approximately 5,180 . The chances are 68 out of 100 the estimate differs from a complete census by less than 5,180. The chances are 95 out of 100 that the estimate differs from a complete census by less than 10,360 (twice the standard error).

Table A. Standard Errors of Estimated Totals
(January to December 1971 Completions)

| (1 Standard Error) |  |
| :---: | :---: |
| Estimated Total | Standard Exror |
|  |  |
| 5,000 | 1,300 |
| 10,000 | 1,850 |
| 15,000 | 2,260 |
| 20,000 | 2,650 |
| 25,000 | 2,950 |
| 35,000 | 3,520 |
| 50,000 | 4,250 |
|  |  |
| 75,000 | 5,280 |
| 100,000 | 7,200 |
| 150,000 | 10,500 |
| 250,000 | 12,500 |
| 350,000 | 15,750 |
| 450,000 | 18,000 |
| 580,000 |  |

Table 1 shows the rate of absorption after three months for these 72,466 units is 72 percent. Table $B$ shows the standard error of a 72 percent rate on a base of 72,466 to be approximately 3.0 percent. Consequently, chances are 68 out of 100 that the estimated rate would be within 3.0 percentage points of a complete census figure and chances are 95 out of 100 that the estimated rate would be within 6.0 percentage points of a census figure; i.e., the 95 percent confidence interval would be from 69.0 to 75.0 percent.

Tabie B. Standard Errors of Estmated Percentages
(January to December 197s Completions)
(1 Standard Error)

| Base of Percentage | Estimated Percentage |  |  |  |  |  |

At what rete are newly constructed apartments rented or otherwise absorbed?
Find the answers in a new quarterly housing report-

## "MARKET ABSORPTION OF APARTMENTS"Series $\mathrm{H}-130$

Because of the recent and continuing boom in apartment construction throughout the Nation, both private industry and Government have an urgent need for information on the nature of the demand for rental housing. This new report is designed to provide data concerning the rate at which non-subsidized and unfurnished privately financed units in buildings with 5 or more units are rented (or absorbed). The "Market Absorption of Apartments" report also provides data on
characteristics of the units such as rent, sizes of apartments, number of bedrooms, the length of time it takes to "rent." The annual report provides additional data on facilities and services offered in new rental units, such as parking, free utilities, swimming pools, etc. This publication is of great value to builders, bankers, market analysts, land planners, and Government officials trying to measure the needs for Federal, State, and local assistance in providing better housing for everyone.

The statistics are based on a survey conducted by the Bureau of the Census, U.S. Department of Commerce, for the Department of Housing and Urban Development.
