Household and Family Characteristics: March 1978

INTRODUCTION

Although the annual estimate of the total number of households in the United States is an essential statistic for a variety of users and uses, it is only the sum of many divergent components. Once this total is disaggregated into its parts, a vast array of data on household and family composition becomes available for use as the basis for a wide range of analyses.

This report contains detailed data on household and family characteristics for March 1978. In addition, it includes more general information on changes which have occurred in the composition and size of households, number and age of persons living alone, presence and age of children, and number and characteristics of families maintained by women.

The data in this report help answer the kinds of questions considered periodically by both regular and occasional users of the Census Bureau's data. For instance, what proportion of all households are maintained by families? Has that proportion changed significantly over the past 15 to 20 years? What percentage of family households include a married couple? Do most couples have children at home? How many children are at home and what are their ages? How many families are maintained by women with no husband present? What percentage of all households have two members? What percentage have six or more? How many persons are living alone and what are their ages?

These and other questions are raised by a diverse group of users. Corporate analysts seeking to assess the market potential of a variety of consumer products often wish to monitor the number of people living alone or in small families. Government policy makers and legislators assessing the level of need and cost of income and health maintenance programs need a wide array of factual information including

changes in the composition of families and the number of women maintaining families without the physical presence and economic support of their husbands. Minority and special interest groups require up-to-date information on their constituency, such as what proportion of Black families are maintained by women, or how many elderly persons live alone, if they are to persuade public and private institutions to take account of their special needs.

Highlights of the topics discussed in the text of the report are:

- The proportion of all households *not* maintained by families increased from 1 of every 7 in 1960 to 1 of every 4 in 1978.
- One-parent families accounted for about 7 percent of all households in 1978, up from 4 percent in 1960.
- The size of the average household declined from 3.33 persons in 1960 to 2.81 persons in 1978, and is likely to remain relatively low if current conditions persist.
- In both 1960 and 1978, 41 percent of those living alone were 65 years old or older.
- Only slightly more than one-half of the Nation's 57.2 million families contained one or more children under age 18 in 1978.
- The women maintaining families in 1978 were generally younger, more likely to have children, more likely to be divorced or never married, and more likely to be Black than their 1960 counterparts.

CHANGES IN HOUSEHOLD TYPES

There were 76.0 million households in the United States in 1978 according to the results of the March Current Population Survey (table A). This constitutes an increase of 23.2

Table A. Composition of Households: 1960 to 1978

Type of household	1978	1975	1970	1965	1960

Other family households.....	5.3	5.4	5.6	6.0	6.4

million households since 1960 when there were 52.8 million households. Due to the substantial increase in the total number of households during the 1960-78 period, the actual number of households of each type was larger in 1978. Some household types have increased more rapidly than others, however, and consequently they now constitute a greater relative proportion of the household total than in 1960.

In 1960, "nonfamily" households accounted for about 1 of every 7 (15 percent) of the households in the country. By 1978, nonfamily households increased their share of all households to 1 of every 4. (In past years, the Bureau has referred to these "nonfamily" households as "primary individual" households. While the label or terminology has changed, this category still represents households occupied either by a person living alone or by two or more persons including no one related to the person maintaining the household.)

The vast majority of these nonfamily households contain persons living alone. In only about 12 percent of these households were there one or more additional companions, partners, or roommates living in the unit. Increases in divorce and the number of elderly women who survive their husbands are among the factors that have contributed to the increase in the number of nonfamily households. Another factor is the increase in the number of young adults who leave their parental home to live in their own apartments, instead of immediately forming a family of their own.

Although family households constituted a smaller share of the total in 1978 (75 percent) than in 1960 (85 percent), there were still about three-times as many family as nonfamily households in 1978. The proportion of households containing a married couple with no children was almost as large (30 percent) as that for households containing a couple with children (32 percent). The proportion of all households comprised of a married couple with no children has shown no significant change since 1960. Married couple households with children, however, accounted for a larger portion of the total (44 percent) in 1960 than in 1978 (32 percent).

About 7 percent of all households in 1978 consisted of one parent (usually the mother) and one or more children. This proportion has increased from 4 percent of all households in 1960.

Finally, there are "other" types of family households such as a brother and sister living together or a grandmother living with her grandchildren. The proportion of these other families in 1978 was about 5 percent, the corresponding proportion for 1960 was slightly higher (6 percent).

AVERAGE HOUSEHOLD SIZE

Given the increase since 1960 in the proportion of nonfamily households and the fact that they rarely contain more than one person, the size of the average household has declined. Other factors, including a period of comparatively low birth rates, have also contributed to the current scarcity of large households.

In 1960, the average household size was 3.33 persons (table B). The most common household size was two persons (28 percent). A slightly higher proportion of households had three persons (19 percent) than had four persons (18 percent), and the percentage of one-person households (13 percent) was a little larger than the percentage of five-person households (12 percent). Finally, the largest households, those with six or more members, constituted 11 percent of the total.

By 1978, average household size had declined to 2.81 persons. The most common household size was still two persons (31 percent), but the next most typical size was the one-person household (22 percent). As in 1960, the proportion of households in 1978 with three persons (17 percent) was slightly higher than the proportion with four persons (16 percent). About 8 percent of households contained five persons, and households with six or more persons comprised only 6 percent.

As long as people continue to show a preference for small families and housing shortages or economic conditions do not force substantial numbers of unmarried persons and families to "double up," average household size is likely to remain relatively low.

PERSONS LIVING ALONE

Persons live alone for essentially the same reasons that they live in the "nonfamily" households described earlier. Whatever the underlying cause or motivation, the number of persons living alone increased from 7.1 million in 1960 to

Table B. Households by Size: 1960 to 1978

Source of 1960 data: U.S. Census of Population: 1960, Vol. II, 4B, "Persons by Family Characteristics."

10.8 million in 1970 to 16.7 million in 1978 (table C). This rapid change represents more than a doubling in the number of these one-person households over the past 18 years.

The age and sex composition of the population living alone has important implications in many areas. For example, if the number of persons living alone included a preponderance of young men age 14 to 24, there would be one set of needs relating to housing policy and consumer products, whereas a preponderance of widows age 65 and over would suggest a rather different pattern of needs.

The most substantial rate of increase in the number of persons living alone has taken place among those 14 to 24 years of age. This group increased sevenfold from 234,000 in 1960 to 1.6 million in 1978. Most of the young adults currently living alone were born during the period of high birth rates in the 1950's. Despite the sizable rate of increase in persons living alone who are 14 to 24 years old, this group still constitutes only 10 percent of the total.

The number of persons who live alone is far larger for those age 65 and over than for those in their teens or early twenties. In 1978, about 41 percent of all persons living alone were 65 and over. Although there has been some fluctuation in this percentage over the years, the proportion of those living alone who were 65 and over was also 41 percent in 1960.

More women than men live alone. Women accounted for 63 percent of the total in 1960 and 68 percent in 1970. The proportion decreased to 62 percent in 1978 largely because of the sharp increase in the number of young unmarried men choosing to live alone. About 5.4 million of the women living alone in 1978 were 65 years old or older. This group, which includes many widows, represented about one-third of the

entire number of persons living alone and over one-half of all women living alone.

FAMILIES AND THE PRESENCE OF CHILDREN

Over the past 10 years, the number of families has increased by 7.4 million, to a total of 57.2 million (table D). About 57.0 million of the total were "primary" families maintaining their own households. A small additional number, about 257,000, were "secondary" families living in a household which was maintained by another person or family group to which they were not related.

In 1978, 53 percent of families included at least one child under 18 years old, about 23 percent had a child under age 6, and 13 percent had a child under age 3. These percentages were somewhat lower than the comparable proportions of families with children in each respective age category in 1968.

Not only have the percentages of families with children under ages 18, 6, and 3 declined as a proportion of all families, but the average number of children in the families which had children has also declined. In 1968, families with any children under 18 were likely to have an average of 2.40 such children, those with children under age 6 had an average of 1.55 children, and those with children under age 3 had an average of 1.20 such children. The corresponding averages for 1978 were 1.96 children under 18, 1.31 children under age 6, and 1.10 under age 3.

CHANGES IN FAMILIES MAINTAINED BY WOMEN

Changes in the number and characteristics of families maintained by women are of interest to those determining

Table D. Families by Presence and Age of Children: 1968 to 1978

(Numbers in thousands)

Under 3 years.....	1.10	1.10	1.15	1.20

social policy. The interest arises in part out of the fact that families in which no husband is present are often among the most impoverished. Thus, not only the number of such families, but also the presence and number of children in them and the marital status and race of the "maintainer" are all factors having important implications that need to be understood by those seeking to alleviate some of the problems likely to be faced by many such families.

The number of families maintained by women increased dramatically between 1960 and 1978, from 4.5 to 8.2 million (table E). The women maintaining these families in 1978 were generally younger, more likely to have children, more likely to be divorced or never married, and more likely to be Black, than their 1960 counterparts.

The median age of women maintaining families has declined from 50.1 years in 1960 to 41.8 years in 1978. The number of families maintained by women under age 35 has more than tripled since 1960, and their share of the total increased from 18 percent in 1960 to 35 percent in 1978.

Many users of data on families maintained by women overlook the fact that these families are not necessarily all mother/child situations. Families comprised of two sisters, or a woman caring for her grandchild or niece, would also be examples of this type of family.

Children under 18 years old were present in 63 percent of the families maintained by women in 1978, the corresponding proportion for 1960 was 47 percent. Not only were today's families more likely to include children, but the average number of children in such families has increased overall from 1.04 to 1.22 children per family. If, however, we consider only those families *with children*, the average has declined from 2.24 to 1.93 children per family. In sum, these families were more likely to have children in 1978 than in 1960, but the families with children were likely to have fewer of them.

In 1960, 52 percent of the women maintaining families were widows. This proportion declined to 29 percent of the total in 1978, although the actual number of such families remained virtually unchanged during the period.

Families maintained by divorced women constituted 15 percent of the total maintained by women in 1960. Since that time, there has been a fourfold increase in the number of such women, and they now account for one-third (34 percent) of the total number of women maintaining families. Another major increase has occurred among single (never-married) women maintaining families. This group has tripled since 1960, and increased from 8 to 16 percent as a proportion of all families maintained by women. Finally, the percentage of married women maintaining families in their husband's absence (usually because of a separation due to marital discord) has declined slightly from 25 percent in 1960 to 22 percent in 1978.

In 1960, Black women made up 21 percent of *all women* maintaining families. By 1978, this proportion had increased to 28 percent. However, Black women maintaining families as a proportion of *all Black families* increased from 22 percent to 39 percent over the same 18-year period (table F).

White women made up 79 percent of *all women* maintaining families in 1960 and 71 percent of the total in 1978. However, White women maintaining families as a proportion of *all White families* increased from 9 percent to 12 percent between 1960 and 1978.

HEAD VERSUS HOUSEHOLDER

In the 1980 census, the Bureau of the Census plans to discontinue the use of the terms "head of household" and "head of family." Instead, the terms "householder" and "family householder" are likely to be used. Recent social changes have resulted in greater sharing of household responsibilities among the adult members and, therefore,

¹Black and other races in 1965 and 1960.

have made the term "head" increasingly inappropriate in the analysis of household and family data. Specifically, the Bureau is reconsidering its longtime practice of always classifying the husband as the head when he and his wife are living together.

In this report, the term "householder" is used for the purpose of acquainting users of census data with the new concept.

In the 1980 census, the householder is to be the first adult household member listed on the census questionnaire. The instructions call for listing first the person (or one of the persons) in whose name the home is owned or rented. If a home is owned jointly by a married couple, either the husband or the wife may be listed first, thereby becoming the reference person, or householder, to whom the relationship of other household members is to be recorded. Thus, the Bureau plans to publish the responses on relationships as given in the 1980 census, except in selected tables where the husband will always be shown as the householder in order to maintain comparability with previous census classifications.

The user of this report is cautioned that the term "householder," as used in the text, refers to the "head," as defined in earlier reports; the term "head" is retained in the detailed tables. Therefore, the number of householders in the text is the same here as the number of heads in the detailed tables. When the 1980 census procedures are used in collecting and processing data in the Current Population Survey in the near future, the number of men classified as householders may be as much as 10 percentage points smaller, and the number of women classified as householders may be as much as 10 percentage points larger, than the corresponding numbers of heads of families or households, according to pretest results.

RELATED REPORTS

Data for 1978 and earlier years on households and families by type were published in Series P-20, No. 327. Results of a study on the marital history of men and women are provided in Series P-20, No. 297, "Number, Timing, and Duration of Marriages and Divorces in the United States: June 1975" and Series P-20, No. 312, "Marriage, Divorce, Widowhood, and Remarriage by Family Characteristics: June 1975." Statistics on the characteristics of female family heads and the members of their families for 1973 and earlier years are presented in Series P-23, No. 50, "Female Family Heads."

Figures for 1978 on age of head and wife for the several types of family units were issued in Series P-20, No. 338, "Marital Status and Living Arrangements: March 1978." Figures on projections for the United States of the number of households and families from 1979 to 1995 have been published in Series P-25, No. 805. Additional statistics for years since 1947 on subjects covered in this report have been published by the Bureau of the Census in other Series P-20 reports.

Statistics on households, families, and related subjects for 1970 for standard metropolitan statistical areas, counties, urbanized areas, cities, States, regions, and the United States are presented in **1970 Census of Population, Volume I,**

Characteristics of the Population, Chapters B, C, and D. Detailed statistics on households and families by age of head for 1970 for States and for large counties and standard metropolitan statistical areas are available in Volume I, chapter D. "Detailed Characteristics." Similar data for the United States and regions, for 1960, have been published in **1960 Census of Population, Volume I, Characteristics of the Population, Part 1, U.S. Summary. Series PC(2)-4A, Family Composition,** presents 1970 census statistics on size and composition of families, number of own children, and family income. These data are cross-classified by such characteristics of the head as age, race, sex, educational attainment, occupation, and income. Area detail is presented for the United States, urbanized areas, and regions. Census statistics on family members by many of these characteristics are shown in Series PC(2)-4B, **Persons by Family Characteristics.**

REORGANIZATION OF DETAILED TABLES

The 23 detailed tables in this report have been regrouped so that tables relating to the characteristics of households now follow those which refer to the characteristics of families. In order to determine the corresponding table as published in the 1977 report, the user should refer to the listing below. Also included in this year's report is a table finding guide which is designed to provide direction to users who are seeking data on a particular characteristic for a certain type of family or household (table G).

NOTE

In the past the Census Bureau has designated a head of household to serve as the central reference person for the collection and tabulation of data for individual members of the household (or family). However, recent social changes have resulted in a trend toward recognition of more equal status for all members of the household (or family), making the term "head" less relevant in the analysis of household and family data. As a result, the Bureau is currently developing new techniques of enumeration and data presentation which will eliminate the concept of "head." While much of the data in this report are based on the concept of "head," methodology for future Census Bureau reports will reflect a gradual movement away from this traditional practice.

Appendix

DEFINITIONS AND EXPLANATIONS

Coverage. The population in this report includes the civilian noninstitutional population of the United States plus approximately 874,000 members of the Armed Forces in the United States living off post or with their families on post in 1977, but excludes all other members of the Armed Forces.

Symbols. A dash "--" represents zero or rounds to zero. The symbol "B" means that the base for the derived figure is less than 75,000. Three dots "... " means not applicable, and "NA" means not available.

Rounding of estimates. Individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded; percentages are based on the unrounded numbers.

Farm-nonfarm residence. The farm population refers to rural residents living on farms. The method of determining farm-nonfarm residence in the present survey and in the Current Population Surveys since March 1960 is the same as that used in the 1960 and 1970 censuses but differs from that used in earlier surveys and censuses. Since March 1960 in the Current Population Surveys, farm residence has been determined by the responses to two questions. Owners are asked "Does this place have 10 or more acres?" and renters are asked "Does the place you rent have 10 or more acres?" If the response is "Yes," the respondent is asked "During the past 12 months, did sales of crops, livestock, and other farm products from this place amount to \$50 or more?" If the acreage response is "No," the inquiry relates to sales of \$250 or more. Rural persons in motels and tourist camps and those living on rented places where no land is used for farming, are not classified as farm population. The nonfarm population, as the term is used here, comprises persons living in urban areas and rural persons not on farms.

Although the method of determining farm-nonfarm residence has not changed since March 1960, the underlying sampling methods and estimation procedures have changed. For a discussion of changes, see **Employment and Earnings**, Volume 18, No. 8, February 1972, pp. 6-9, published by the Bureau of Labor Statistics.

Tenure. A housing unit is "owner occupied" if the owner or co-owner lives in the unit, even if it is mortgaged or not fully paid for. A cooperative or condominium unit is "owner occupied" only if the owner or co-owner lives in it. All other occupied units are classified as "renter occupied," including

units rented for cash rent and those occupied without payment of cash rent.

Units in structure. In the determination of the number of units in a structure, all housing units, both occupied and vacant, were counted. The statistics are presented in terms of the number of occupied housing units in structures of specified size, not in terms of the number of residential structures.

Marital status. The marital status classification identifies four major categories: single, married, widowed, and divorced. These terms refer to the marital status at the time of the enumeration.

The category "married" is further divided into "married, spouse present," "separated," and "other married, spouse absent." A person was classified as "married, spouse present" if the husband or wife was reported as a member of the household, even though he or she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration. Persons reported as separated included those with legal separations, those living apart with intentions of obtaining a divorce, and other persons permanently or temporarily separated because of marital discord. The group "other married, spouse absent" includes married persons living apart because either the husband or wife was employed, and living at a considerable distance from home, was serving away from home in the Armed Forces, had moved to another area, or had a different place of residence for any other reason except separation as defined above.

Husband in Armed Forces. When a woman was reported as married but her husband was not enumerated as a member of the same household, an additional question was asked to determine whether her husband was in the Armed Forces. Women who were reported as separated were not asked the additional question.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is either (1) direct access from the outside or through a common hall or (2) a kitchen or cooking equipment for the exclusive use of the occupants.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children,

wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

Group quarters. Group quarters are now defined in the Current Population Survey as noninstitutional living arrangements for groups not living in conventional housing units or groups living in housing units containing five or more persons unrelated to the person in charge. Inmates of institutions (starting in 1972) are not included in the Current Population Survey.

Family. The term "family," as used here, refers to a group of two persons or more related by birth, marriage, or adoption and residing together; all such persons are considered as members of one family. A lodger and his/her spouse who are not related to the person or persons who maintain the household, or a resident employee and his/her spouse living in, are considered as a separate family. Thus, a household may contain more than one family. However, if the son of the person or couple who maintains the household and the son's wife are members of the household, they are treated as part of the parent's family. A person maintaining a household alone, or with unrelated persons only, is regarded as a household but not as a family. Thus, some households do not contain a family.

Primary family. A primary family is a family that includes among its members the person or couple who maintains the household. In the text of this report the term "family households" is used in discussing the households of primary families—a term used in the detailed tables.

Secondary family. A secondary family is a family that does not include among its members the person or couple who maintains the household, or any persons related to the person or couple who maintains the household. Members of secondary families may include persons such as guests, lodgers, or resident employees and their relatives living in a household.

Persons living with relatives in group quarters were formerly considered as members of secondary families. However, the number of such families became so small (37,000 in 1967) that beginning with data for 1968 (and beginning with census data for 1960) the Bureau of the Census includes persons in these families in the count of secondary individuals.

Subfamily. A subfamily is a married couple with or without children, or one parent with one or more own single children under 18 years old, living in a household and related to, but not including, the person or couple who maintains the household. The most common example of a subfamily is a young married couple sharing the home of the husband's or wife's parents. Members of a subfamily are also members of a primary family. The number of subfamilies, therefore, is not included in the number of families.

Married couple. A married couple, as defined for census purposes, is a husband and his wife enumerated as members of the same household. The married couple may or may not have children living with them. The expression "husband-wife" or "married-couple" before the term "household," "family," or "subfamily" indicates that the household, family, or subfamily is maintained by a husband and wife. Detailed tables which display data for characteristics of the head (e.g., age, sex, race) for households or families show characteristics of the husband in husband-wife households or families.

Unrelated individuals. Unrelated individuals are persons (other than inmates of institutions) who are not living with any relatives. An unrelated individual may be (1) a person living alone or with nonrelatives only, (2) a lodger or resident employee with no relatives in the household, or (3) a group quarters member who has no relatives living with him/her. Thus, a widow who occupies her house alone or with one or more other persons not related to her, a roomer not related to anyone else in the housing unit, a maid living as a member of her employer's household but with no relatives in the household, and a resident staff member in a hospital living apart from any relatives are all examples of unrelated individuals.

Primary individual. A primary individual is a person maintaining a household while living alone or with nonrelatives only. In the text of this report the term "nonfamily households," is used in discussing the households of primary individuals—a term used in the detailed tables.

Secondary individual. A secondary individual is a person in a household or group quarters such as a guest, lodger, or resident employee (excluding primary individuals and inmates of institutions) who is not related to any other person in the household or group quarters. (See section above on "Secondary family" for slight change in coverage of secondary individuals in 1968.)

Size of household, family, or subfamily. The term "size of household" includes all persons occupying a housing unit. "Size of family" includes persons in the living quarters who are related to each other by birth, marriage, or adoption. "Size of subfamily" includes the husband and wife or the lone parent and their sons and daughters under 18 years of age who constitute a subfamily. If a primary family has a subfamily among its members, the size of the primary family includes the members of the subfamily.

Related persons and family members. In the classification of households by number of related persons, the person or couple who maintains the household or (housing unit) and all persons in the household related to them are included. In the classification of families by number of family members, all persons in the family are included. The number of family members is the same as the size of the family.

Own children and related children. "Own" children in a family are sons and daughters, including stepchildren and adopted children, of the householder maintaining the family. Similarly, "own" children in a subfamily are sons and daughters of the married couple or parent in the subfamily. "Related" children in a family include own children and all other children in the household who are related to the householder by birth, marriage, or adoption. All children shown as members of subfamilies are own children. For each type of family unit identified in the CPS, the count of own children under 18 years old is limited to single (never married) children; however, "own children under 25" and "own children of any age," as the terms are used here, include all children regardless of marital status.

The count of related children in families was formerly restricted to single (never married) children. However, beginning with data for 1968 the Bureau of the Census includes ever-married children under the category of related children. This change added approximately 20,000 children to the category of related children in March 1968.

Years of school completed. In this report, data on years of school completed were derived from the combination of answers to two questions, (a) "What is the highest grade of school that the person has attended?" and (b) "Did the person finish this grade?"

The questions on educational attainment applied only to progress in "regular" schools. Such schools include public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, "regular" schooling is that which advances a person toward an elementary or high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

Labor force and employment status. The definitions of labor force and employment status in this report related to the population 14 years old and over.

Employed. Employed persons comprise (1) all civilians who, during the specified week, did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (such as own home housework, painting or repairing own home, etc.) or volunteer work for religious, charitable, and similar organizations.

Unemployed. Unemployed persons are those civilians who, during the survey week, had no employment but were available for work and (1) had engaged in any specific job-seeking activity within the past 4 weeks, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) were waiting to be called back to a job from which they had been laid off; or (3) were waiting to report to a new wage or salary job within 30 days.

Labor force. Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" is comprised of all civilians classified as employed or unemployed.

Not in the labor force. All civilians who are not classified as employed or unemployed are defined as "not in the labor force." This group who are neither employed nor seeking work includes persons engaged only in own home housework, attending school, or unable to work because of long-term physical or mental illness; persons who are retired or too old to work, seasonal workers for whom the survey week fell in an off season, and the voluntary idle. Persons doing only unpaid family work (less than 15 hours) are also classified as not in the labor force.

Occupation. The data on occupation of employed persons refer to the civilian job held during the survey week. Persons employed at two or more jobs were reported in the job at which they worked the greatest number of hours during the week.

The occupation groupings used here are mainly the major groups used in the 1970 Census of Population. The composition of these groups is shown in Volume 1, Characteristics of the Population, Part 1, United States Summary, chapter D. The categories used are either detailed classifications or combinations thereof.

Metropolitan-nonmetropolitan residence. The population residing in standard metropolitan statistical areas (SMSA's) constitutes the metropolitan population. Except in New England, an SMSA is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county, or counties, containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central county. In New England SMSA's consist of towns and cities, rather than counties. The metropolitan population in this report is based on SMSA's as defined in the 1970 census and does not include any subsequent additions or changes.

Central cities. Each SMSA must include at least one central city, and the complete title of an SMSA identifies the central

city or cities. If only one central city is designated, then it must have 50,000 inhabitants or more. The area title may include, in addition to the largest city, up to two city names on the basis and in the order of the following criteria: (1) The additional city has at least 250,000 inhabitants or (2) the additional city has a population of one-third or more of that of the largest city and a minimum population of 25,000. An exception occurs where two cities have contiguous boundaries and constitute, for economic and social purposes, a single community of at least 50,000, the smaller of which must have a population of at least 15,000.

Age. The age classification is based on the age of the person at the person's last birthday.

Race. The population is divided into three groups on the basis of race: White, Black, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except White and Black. In this report, "other races" are usually shown in combination with the Black population.

Persons of Spanish origin. Persons of Spanish origin in this report were determined on the basis of a question that asked for self-identification of the person's origin or descent. Respondents were asked to select their origin (or the origin of some other household member) from a "flash card" listing ethnic origins. Persons of Spanish origin, in particular, were those who indicated that their origin was Mexican, Puerto Rican, Cuban, Central or South American, or some other Spanish origin. Persons of Spanish origin may be of any race.

SOURCE AND RELIABILITY OF THE ESTIMATES

Source of Data

Most of the estimates in this report are based on data obtained from the Current Population Survey (CPS) of the Bureau of the Census. Some data, as footnoted in the tables, were obtained from the 1960 Census of Population. Brief descriptions of the sources and procedures through which data were obtained are presented below.

Current Population Survey (CPS). The CPS estimates in this report are based on data obtained annually in March of 1960 through 1978. The monthly CPS deals mainly with labor force data for the civilian noninstitutional population. Questions relating to labor force participation are asked about each member 14 years old and older in each sample household. In addition, supplementary questions are asked each March about household and family characteristics. In order to obtain more reliable data for the Spanish origin population, the March CPS sample was enlarged to include all households from the November 1977 sample which contained at least one person of Spanish origin.

The present CPS sample was initially selected from the 1970 census file and is updated continuously to reflect new construction where possible (see section, "Nonsampling Variability," below). The monthly CPS sample is spread over 461 areas with coverage in each of the 50 States and the District of Columbia. A supplementary sample of housing units in 24 States and the District of Columbia was incorporated with the monthly CPS sample to produce the March 1978 household and family data. The expanded CPS sample is located in 614 areas comprising 1,113 counties, independent cities, and divisions in the nation. The 614 sample areas used in March include 461 areas from the monthly CPS and 153 supplementary areas.

Samples for previous sample designs were selected from files from the most recently completed census. The following table provides a description of some aspects of the CPS sample designs in use during the referenced data collection periods.

The estimating procedure used for the monthly CPS data involves the inflation of weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates were based on statistics from decennial censuses; statistics on births, deaths, immigration, and emigration; and statistics on the strength of the Armed Forces. For this report, persons in the Armed Forces living off post or with

Description of the Current Population Survey

Time period	Number of sample areas ¹	Households eligible		Housing units visited, not eligible ²
		Interviewed	Not interviewed	
Supplemental sample.....	153	8,500	500	1,500
Aug. 1972 to present.....	461	45,000	2,000	8,000
Aug. 1971 to July 1972.....	449	45,000	2,000	8,000
Jan. 1967 to July 1971.....	449	48,000	2,000	8,500
Mar. 1963 to Dec. 1966.....	357	33,500	1,500	6,000
Jan. 1960 to Feb. 1963.....	³ 333	33,500	1,500	6,000

¹These areas were chosen to provide coverage in each State and the District of Columbia with the exception of the supplemental sample used for March 1978 data.

²These are housing units which were visited, but were found to be vacant or otherwise not eligible for interview.

³Three sample areas were added in 1960 to represent Alaska and Hawaii after statehood.

their families on post were also included. The estimation procedure for the data in the report also involved a further adjustment so that husband and wife of a household received the same weight.

Decennial Census of Population. Decennial census data for 1960 in this report, as footnoted, are based on a 5-percent sample. Descriptions of the samples from the census can be found in the appropriate census publications.

Reliability of the Estimates

Since the CPS estimates in this report were based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same questionnaires, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey—sampling and non-sampling. The standard errors provided for this report primarily indicate the magnitude of the sampling errors. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any systematic biases in the data. The full extent of the nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates.

Nonsampling variability. Nonsampling errors can be attributed to many sources, e.g., inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness to provide correct information on the part of respondents, inability to recall information, errors made in collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all units with the sample (undercoverage).

Undercoverage in the CPS results from missed housing units and missed persons within sample households. Overall undercoverage, as compared to the level of the decennial census, is about 5 percent. It is known that CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races than for Whites. Ratio estimation to independent age-sex-race population controls, as described previously, partially corrects for the bias due to survey undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics than interviewed persons in the same age-sex-race group. Further, the independent population controls used have not been adjusted for undercoverage in the 1970 census, which was estimated at 2.5 percent of the population, with similar undercoverage differentials by age, sex, and race as in CPS.

The approximate magnitude of the two sources of undercoverage of housing units is known. Of the 83 million housing units in the United States, about 600,000 new construction

housing units other than mobile homes are not represented in the CPS sample because they were assigned building permits prior to January 1970, but building was not completed by the time of the census (i.e., April 1970). Almost all conventional new construction, for which building permits were issued after 1969, is represented. About 290,000 occupied mobile homes are not represented in CPS; these units were either missed in the census or have been built or occupied since the census. These estimates of missed units are relevant to the present sample only and not to earlier designs where the extent of undercoverage was generally less. The extent of other sources of undercoverage of housing units is unknown but believed to be small.

Sampling variability. The standard errors given in the following tables are primarily measures of sampling variability, that is, of the variations that occurred by chance because a sample rather than the entire population was surveyed. The sample estimate and its estimated error enable one to construct confidence intervals, ranges that would include the average result of all possible samples with a known probability. For example, if all possible samples were selected, each of these surveyed under essentially the same general conditions and using the same sample design, and an estimate and its estimated standard error were calculated from each sample, then:

1. Approximately 68 percent of the intervals from one standard error below the estimate to one standard error above the estimate would include the average result of all possible samples.
2. Approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples.
3. Approximately 95 percent of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average result of all possible samples.

The average estimate derived from all possible samples is or is not contained in any particular computed interval. However, for a particular sample, one can say with a specified confidence that the average estimate derived from all possible samples is included in the confidence interval.

All the statements of comparison appearing in the text are significant at a 1.6 standard error level or better, and most are significant at a level of more than 2.0 standard errors. This means that for most differences cited in the text, the estimated difference is greater than twice the standard error of the difference. Statements of comparison qualified in some way (e.g., by use of the phrase, "some evidence") have a level of significance between 1.6 and 2.0 standard errors.

Comparability with other data. Caution should be used in comparing estimates from 1978, when the expanded sample was used, to those from 1975 and earlier years. Some relatively large differences in estimates of population in

city or cities. If only one central city is designated, then it must have 50,000 inhabitants or more. The area title may include, in addition to the largest city, up to two city names on the basis and in the order of the following criteria: (1) The additional city has at least 250,000 inhabitants or (2) the additional city has a population of one-third or more of that of the largest city and a minimum population of 25,000. An exception occurs where two cities have contiguous boundaries and constitute, for economic and social purposes, a single community of at least 50,000, the smaller of which must have a population of at least 15,000.

Age. The age classification is based on the age of the person at the person's last birthday.

Race. The population is divided into three groups on the basis of race: White, Black, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except White and Black. In this report, "other races" are usually shown in combination with the Black population.

Persons of Spanish origin. Persons of Spanish origin in this report were determined on the basis of a question that asked for self-identification of the person's origin or descent. Respondents were asked to select their origin (or the origin of some other household member) from a "flash card" listing ethnic origins. Persons of Spanish origin, in particular, were those who indicated that their origin was Mexican, Puerto Rican, Cuban, Central or South American, or some other Spanish origin. Persons of Spanish origin may be of any race.

SOURCE AND RELIABILITY OF THE ESTIMATES

Source of Data

Most of the estimates in this report are based on data obtained from the Current Population Survey (CPS) of the Bureau of the Census. Some data, as footnoted in the tables, were obtained from the 1960 Census of Population. Brief descriptions of the sources and procedures through which data were obtained are presented below.

Current Population Survey (CPS). The CPS estimates in this report are based on data obtained annually in March of 1960 through 1978. The monthly CPS deals mainly with labor force data for the civilian noninstitutional population. Questions relating to labor force participation are asked about each member 14 years old and older in each sample household. In addition, supplementary questions are asked each March about household and family characteristics. In order to obtain more reliable data for the Spanish origin population, the March CPS sample was enlarged to include all households from the November 1977 sample which contained at least one person of Spanish origin.

The present CPS sample was initially selected from the 1970 census file and is updated continuously to reflect new construction where possible (see section, "Nonsampling Variability," below). The monthly CPS sample is spread over 461 areas with coverage in each of the 50 States and the District of Columbia. A supplementary sample of housing units in 24 States and the District of Columbia was incorporated with the monthly CPS sample to produce the March 1978 household and family data. The expanded CPS sample is located in 614 areas comprising 1,113 counties, independent cities, and divisions in the nation. The 614 sample areas used in March include 461 areas from the monthly CPS and 153 supplementary areas.

Samples for previous sample designs were selected from files from the most recently completed census. The following table provides a description of some aspects of the CPS sample designs in use during the referenced data collection periods.

The estimating procedure used for the monthly CPS data involves the inflation of weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates were based on statistics from decennial censuses; statistics on births, deaths, immigration, and emigration; and statistics on the strength of the Armed Forces. For this report, persons in the Armed Forces living off post or with

their families on post were also included. The estimation procedure for the data in the report also involved a further adjustment so that husband and wife of a household received the same weight.

Decennial Census of Population. Decennial census data for 1960 in this report, as footnoted, are based on a 5-percent sample. Descriptions of the samples from the census can be found in the appropriate census publications.

Reliability of the Estimates

Since the CPS estimates in this report were based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same questionnaires, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey—sampling and non-sampling. The standard errors provided for this report primarily indicate the magnitude of the sampling errors. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any systematic biases in the data. The full extent of the nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates.

Nonsampling variability. Nonsampling errors can be attributed to many sources, e.g., inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness to provide correct information on the part of respondents, inability to recall information, errors made in collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all units with the sample (undercoverage).

Undercoverage in the CPS results from missed housing units and missed persons within sample households. Overall undercoverage, as compared to the level of the decennial census, is about 5 percent. It is known that CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races than for Whites. Ratio estimation to independent age-sex-race population controls, as described previously, partially corrects for the bias due to survey undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics than interviewed persons in the same age-sex-race group. Further, the independent population controls used have not been adjusted for undercoverage in the 1970 census, which was estimated at 2.5 percent of the population, with similar undercoverage differentials by age, sex, and race as in CPS.

The approximate magnitude of the two sources of undercoverage of housing units is known. Of the 83 million housing units in the United States, about 600,000 new construction

housing units other than mobile homes are not represented in the CPS sample because they were assigned building permits prior to January 1970, but building was not completed by the time of the census (i.e., April 1970). Almost all conventional new construction, for which building permits were issued after 1969, is represented. About 290,000 occupied mobile homes are not represented in CPS; these units were either missed in the census or have been built or occupied since the census. These estimates of missed units are relevant to the present sample only and not to earlier designs where the extent of undercoverage was generally less. The extent of other sources of undercoverage of housing units is unknown but believed to be small.

Sampling variability. The standard errors given in the following tables are primarily measures of sampling variability, that is, of the variations that occurred by chance because a sample rather than the entire population was surveyed. The sample estimate and its estimated error enable one to construct confidence intervals, ranges that would include the average result of all possible samples with a known probability. For example, if all possible samples were selected, each of these surveyed under essentially the same general conditions and using the same sample design, and an estimate and its estimated standard error were calculated from each sample, then:

1. Approximately 68 percent of the intervals from one standard error below the estimate to one standard error above the estimate would include the average result of all possible samples.
2. Approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples.
3. Approximately 95 percent of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average result of all possible samples.

The average estimate derived from all possible samples is or is not contained in any particular computed interval. However, for a particular sample, one can say with a specified confidence that the average estimate derived from all possible samples is included in the confidence interval.

All the statements of comparison appearing in the text are significant at a 1.6 standard error level or better, and most are significant at a level of more than 2.0 standard errors. This means that for most differences cited in the text, the estimated difference is greater than twice the standard error of the difference. Statements of comparison qualified in some way (e.g., by use of the phrase, "some evidence") have a level of significance between 1.6 and 2.0 standard errors.

Comparability with other data. Caution should be used in comparing estimates from 1978, when the expanded sample was used, to those from 1975 and earlier years. Some relatively large differences in estimates of population in

metropolitan and nonmetropolitan areas have been observed between the 461 and the 614 area samples. These differences reflect a relatively large increase in variance on those estimates and do not represent actual changes in the population.

Note when using small estimates. Summary measures (such as averages and percent distributions) are shown in the report only when the base of the measure is 75,000 or greater. Because of the large standard errors involved, there is little chance that summary measures would reveal useful information when computed on a smaller base. Estimated numbers are shown, however, even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories as serve each user's need.

Standard errors for data based on the decennial census. Sampling errors on all data from the 5-percent sample of the 1960 decennial census shown in this report are small enough to be disregarded. However, the standard errors may be found in the appropriate census volumes.

Standard error tables and their use. In order to derive standard errors that would be applicable to a large number of estimates and could be prepared at a moderate cost, a number of approximations were required. Therefore, instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. As a result, the sets of standard errors provided give an indication of the order of magnitude of the standard error of an estimate rather than the precise standard error.

Table A-1. Standard Errors of Estimated Numbers

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
25.....	10	5,000.....	144
50.....	15	10,000.....	201
100.....	21	15,000.....	243
250.....	33	25,000.....	306
500.....	46	50,000.....	403
1,000.....	65	100,000.....	475
2,500.....	103		

Note: For a particular characteristic, see table A-3 for the appropriate factor to apply to the above errors. To estimate standard errors for 1960 and 1965, multiply the above standard errors by 1.2.

Table A-2. Standard Errors of Estimated Percentages

(68 chances out of 100)

Base of estimated percentage (thousands)	Estimated percentage					
	1 or 99	2 or 98	5 or 95	10 or 90	25 or 75	50
75.....	2.4	3.3	5.2	7.1	10.3	11.9
100.....	2.0	2.9	4.5	6.2	8.9	10.3
250.....	1.3	1.8	2.8	3.9	5.6	6.5
500.....	0.9	1.3	2.0	2.8	4.0	4.6
1,000.....	0.6	0.9	1.4	2.0	2.8	3.3
2,500.....	0.4	0.6	0.9	1.2	1.8	2.1
5,000.....	0.3	0.4	0.6	0.9	1.2	1.5
10,000.....	0.2	0.3	0.4	0.6	0.9	1.0
15,000.....	0.2	0.2	0.4	0.5	0.7	0.8
25,000.....	0.13	0.2	0.2	0.4	0.6	0.7
50,000.....	0.09	0.13	0.3	0.3	0.4	0.5
100,000.....	0.06	0.09	0.14	0.2	0.3	0.3

Note: For a particular characteristic, see table A-3 for the appropriate factor to apply to the above errors. To estimate standard errors for 1960 and 1965, multiply the above standard errors by 1.2.

The figures in tables A-1 and A-2 provide approximations to standard errors of estimated numbers and estimated percentages. Standard errors for intermediate values not shown in the generalized tables of standard errors may be approximated by linear interpolation. Estimated standard errors for specific characteristics cannot be obtained from tables A-1 or A-2 without the use of factors in table A-3. These factors must be applied to the generalized standard errors in order to adjust for the combined effect of sample design and estimating procedure on the value of the characteristic. The factors for all household members should be used for characteristics pertaining to all persons in a household. For characteristics which include only some household members, such as "children under 18 years of age," the factor for some household members should be used.

Two parameters (denoted "a" and "b") are used to calculate standard errors for each type of characteristic; they are presented in table A-4. These parameters were used to calculate the standard errors in tables A-1 and A-2, and to calculate the factors in table A-3. They also may be used to directly calculate the standard errors for estimated numbers and percentages. Methods for direct computation are given in the following sections.

Standard errors of estimated numbers. The approximate standard error, σ_x , of an estimated number shown in this report can be obtained in two ways. It may be obtained by use of the formula

$$\sigma_x = f\sigma \quad (1)$$

where f is the appropriate factor from table A-3, and σ is the standard error on the estimate obtained by interpolation from table A-1. Alternatively, standard errors may be approximated by formula (2) from which the standard errors were calculated in table A-1. Use of this formula will provide more accurate results than the use of formula (1) above.

$$\sigma_x = \sqrt{ax^2 + bx} \quad (2)$$

Here x is the size of the estimate and a and b are the parameters in table A-4 associated with the particular type of characteristic.

Standard errors of estimated percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which the percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the factor or parameters from table A-3 or A-4 indicated by the numerator. The approximate standard error, $\sigma_{(x,p)}$, of an estimated percentage can be obtained by use of the formula

$$\sigma_{(x,p)} = f\sigma \quad (3)$$

Table A-3. Factors to be Applied to Generalized Standard Errors in Tables A-1 and A-2

(For meaning of symbols, see text)

Characteristics	CPS Data collected January 1967 to present								
	Persons						Families and unrelated individuals, households, householders, or primary individuals		
	Some household members and secondary individuals			All household members			Total or white	Black	Spanish origin
	Total or white	Black	Spanish origin	Total or white	Black	Spanish origin			
TOTAL UNITED STATES OR NONFARM									
Household and family ¹	0.91	1.09	1.02	1.00	1.32	1.45	0.57	0.54	0.58
Residence: regional or metropolitan and nonmetropolitan.....	1.00	1.32	1.45	0.71	0.78	0.82
Education, tenure, employment status, and occupation ¹	0.57	0.54	0.58
FARM									
Household and family ¹	1.25	1.50	1.41	1.38	1.82	2.00	0.84	0.80	0.85

¹For metropolitan-nonmetropolitan data cross-tabulated with this characteristic, multiply the factor of interest in this row by 1.4.

In this formula f is the appropriate factor from table A-3, and σ is the standard error on the estimate from table A-2. Alternatively, standard errors may be approximated by formula (4), from which standard errors in table A-2 were calculated; direct computation will give more accurate results than use of the standard error tables and the factors.

$$\sigma_{(x,p)} = \sqrt{\frac{b}{x} \cdot p(100-p)} \quad (4)$$

Here x is the size of the subclass of persons, families and unrelated individuals, households, householders or primary individuals which is the base of the percentage, p is the percentage ($0 \leq p \leq 100$), and b is the parameter in table A-4 associated with the particular type of characteristic in the numerator of the percentage.

Illustration of the use of standard error tables. Table C of this report shows that in 1978 there were 16,715,000

Table A-4. "a" and "b" Parameters for Estimated Numbers and Percentages of Persons, Families and Unrelated Individuals, Households, Householders, or Primary Individuals

(For meaning of symbols, see text)

¹Multiply parameters by 1.5 for data from 1960 and 1965.

²For metropolitan-nonmetropolitan data cross-tabulated with another characteristic, multiply that characteristic's parameters by 2.0.

persons 14 years and over living alone. Table A-1 shows the standard error on an estimate of this size to be approximately 254,000. Applying the appropriate factor from table A-3 and using formula (1), the approximate standard error is $0.57 \times 254,000 = 145,000$.¹ The 68-percent confidence interval as shown by the data is from 16,570,000 to 16,860,000. Therefore, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. Similarly we could conclude that the average estimate derived from all possible samples lies within the interval from 16,425,000 to 17,005,000 (using twice the standard error) with 95-percent confidence.

Of these 16,715,000 persons, 1,611,000 or 9.6 percent were 14 to 24 years old. Since the numerator of this percentage is persons living alone and the characteristic relates to households with unrelated individuals, the appropriate b parameter from table A-4 is 1,389. Using formula (4), the standard error on an estimate of 9.6 percent is

$$\sqrt{\frac{1,389}{16,715,000} (9.6) (90.4)} \approx 0.3 \text{ percent}^2$$

Consequently, the 68-percent confidence interval as shown by these data is from 9.3 to 9.9 percent, and the 95-percent confidence interval is from 9.0 to 10.2 percent.

Standard error of a difference. For a difference between two sample estimates, the standard error is approximately equal to

$$\sigma_{(x-y)} = \sqrt{\sigma_x^2 + \sigma_y^2} \quad (5)$$

where σ_x and σ_y are the standard errors of the estimates x and y ; the estimates can be of numbers, percents, ratios, etc. This will represent the actual standard errors quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive or negative correlation between the two characteristics, the formula will overestimate or underestimate the true standard error.

Illustration of the computation of the standard error of a difference. Table F of this report shows that 11.5 percent of all White families in 1978 were maintained by women while 39.2 percent of all Black families in 1978 were maintained by women. The apparent difference between the percent of families maintained by White women and those maintained by Black women is 27.7 percent. The standard error on the 11.5 percent of White families maintained by women is 0.2 percent. The standard error on the 39.2 percent of Black families maintained by women is 0.7 percent. Therefore, the standard error of the estimated difference of 27.7 percent is about

$$0.7 \text{ percent} \approx \sqrt{(0.2)^2 + (0.7)^2}$$

¹ Formula (2) for this example gives a standard error of 143,000.

² Table A-2 and formula (3) also give a standard error of 0.3 percent.

This means that the 68-percent confidence interval for the difference is from 27.0 to 28.4 percent. A conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. The corresponding 95-percent confidence interval is 26.3 to 29.1 percent. Thus, we can conclude with 95-percent confidence that there is a difference between the 1978 percentage of families maintained by White women and the percentage of families maintained by Black women.

Standard error of a ratio. Certain mean values for persons in families shown in the tables of this report were calculated as the ratio of two numbers. For example, the mean number of persons per family is calculated as

$$\frac{x}{y} = \frac{\text{total number of persons in families}}{\text{total number of families}}$$

Standard errors for these means may be approximated as shown below. There are two cases to consider. In either case, the denominator y represents a count of families of a certain class, and the numerator x represents a count of persons with the characteristic under consideration who are members of these families.

Case 1: There is at least one person having the characteristics in every family of the class: as for example, the mean number of persons per family or the mean number of persons per family with a male head. For ratios of this kind, the standard error is approximated by the following formula:

$$\sigma_{\frac{x}{y}} = \sqrt{\left(\frac{x}{y}\right)^2 \left[\left(\frac{\sigma_y}{y}\right)^2 + \left(\frac{\sigma_x}{x}\right)^2 - 2\rho \left(\frac{\sigma_x}{x}\right) \left(\frac{\sigma_y}{y}\right) \right]} \quad (6)$$

The standard error of the estimated number of families, σ_y , and the standard error of the estimated number of persons with the characteristics in those families, σ_x , may be calculated by the methods described above. In formula (6), ρ represents the correlation coefficient between the numerator and the denominator of the estimate. In the above examples, and for other ratios of this kind, use 0.7 as an estimate of ρ .

Case 2: The number of persons having the characteristic in a given family may be 0, 1, 2, 3, or more: for example, the mean number of persons under 18 years of age. For ratio of this kind the standard error is approximated by formula (6) but ρ is assumed to be zero. If ρ is actually positive, then this procedure will provide an overestimate of the standard error of the ratio.

Standard error of a median. The sampling variability of an estimated median depends upon the form of the distribution as well as the size of its base. An approximate method for

measuring the reliability of a median is to determine an interval about the estimated median, such that there is a stated degree of confidence that the median based on a complete census lies within the interval. The following procedure may be used to estimate the 68-percent confidence limits of a median based on sample data.

1. Determine, using the standard error tables and factors or formula (4), the standard error of the estimate of 50 percent from the distribution.
2. Add to and subtract from 50 percent the standard error determined in step (1).
3. Using the distribution of the characteristic, calculate the confidence interval corresponding to the two points established in step (2).

A 95-percent confidence interval may be determined by finding the values corresponding to 50 percent plus and minus twice the standard error determined in step (1).

Illustration of the computation of a confidence interval for a median. Table E of this report shows that the median age of women maintaining families was 41.8 years in 1978. The size, or base, of the distribution from which this median was determined is 8,236,000.

1. Using formula (4), the standard error of 50 percent on a base of 8,236,000 is about 0.65 percent.
2. To obtain a 95-percent confidence interval on an estimated median, add to and subtract from 50 percent twice the standard error found in step (1). This yields percent limits of 48.7 and 51.3.
3. From table E, 34.6 percent of women maintaining families were under 35 years old and 22.5 percent were between 35 to 44 years old. By linear interpolation, the lower limit on the estimate is found to be about

$$35 \text{ yrs.} + (10) \left[\frac{48.7 - 34.6}{22.5} \right] = 41.3 \text{ years}$$

Similarly, the upper limit may be found by linear interpolation to be about

$$35 \text{ yrs.} + (10) \left[\frac{51.3 - 34.6}{22.5} \right] = 42.4 \text{ years}$$

Thus, the 95-percent confidence interval on the estimated median is from 41.3 to 42.4 years.
