## Projections of the Number of Households and Families: 1979 to 1995

This report presents projections of the number of households and families for the years 1979 to 1995 . Four main series (Series A, B, C, and D) and an analytical series (Series K) are presented on the number of households by type. Data on households by age of householder, the average size of households and families, and the marital status of the population by age are also presented in Series $A, B, C$, and D.

These projections of households are illustrative; that is, they are designed to indicate the number of households which would result from applying certain assumptions about future rates of household formation and population change. They are based on extrapolations to 1995 of changes in marital status and household status observed over the period from 1964 to 1978 and on the most recent projections of the total population by age and sex for Series A, B, and D. In the case of Series $C$, different time periods were used to extrapolate to 1980 and 1995. (For further discussion, see section on methods and assumptions.)

The household and family projections were prepared on the assumption that there would be no general war or other catastrophe during the projection period. The projections assume that the number of Armed Forces abroad and in military barracks in the United States would continue at the level of 1.3 million, as estimated for July 1, 1977.

The tables show estimates for various dates based on current surveys of the Census Bureau for comparison with the projections. Since the survey data are based on samples of the population, they are subject to sampling error. For estimates of the sampling error of the survey data, see Current Population Reports, Series P-20, No. 326.

The increase in the number of households (occupied housing units) which may occur by 1995 is not necessarily identical with the volume of housing construction which may take place during this period. The number of housing units constructed is likely to differ from the increase in the number of households because of changes in the number of vacant units, the demolition of existing units, and conversions or mergers of units in existing structures.

## 'EVALUATION OF PROJECTIONS PUBLISHED IN 1975

Table $A$ shows data on the number of households by type from the Series B (old) projections published in Series P-25, No. 607, the present Series B (new) and Series C (new) projections, and from the March Current Population Survey (CPS) results of 1975 to 1978. Series B in P-25, No. 607 was
developed from a trend in marital status and householder proportions over the time period from 1960 to 1974 . The new Series $B$ projections were derived from trends in marital status and householder proportions over the 1964-78 period. Series $C$ in the present report utilizes a short-term trend (1974 to 1978) to project to 1980 and a long-term trend (1966 to 1980) to project levels for 1995.

While the old Series B did fairly well in projecting the total number of households over the years for which comparisons with estimates from the CPS may be made, the projections of the component types of households were less favorably comparable to the CPS generated estimates. Series $B$ was higher than the CPS in the number of husband-wife households and lower in the number of both nonfamily and female family households.

Both of the new projection series shown in table $A$ for the years 1980 to 1990 have considerably lower values for husband-wife households and higher values for female family households and nonfamily households than those in old Series B.

Since the methodological approach of using householder proportions for each projection series shown is the same, the variations seen between old Series B, new Series B, and new Series $C$ are purely a function of the use of different base periods for the extrapolation of rates.

## INCREASE IN THE NUMBER OF HOUSEHOLDS

According to the highest series of household projections (Series A), the number of households in the United States would reach 107.5 million by July 1, 1995; this figure implies an increase of 31.5 million during the $1978-95$ period over the 76.0 million of March 1978 (table 1). The lowest series (Series D) indicates that there would be 97.2 million households in 1995; this figure implies an increase of 21.2 million households during the 1978.95 period. These two series of projections show increases of 41 and 28 percent, respectively, over the projection period.

The number of households in the United States showed an average annual increase of 1.5 million between 1970 and 1975 (table B). Between 1975 and 1980, the average annual increase may range from 1.5 to 1.7 million as can be seen in table $B$. The highest average annual increase in the number of households for future periods, on a 5 -vear basis, is seen in projection Series $A$, which shows a gain of 1.9 million per
year in the 1980-85 period. The lowest average annual increase for future 5 -year periods is given by Series $D$ which shows an increase of only 1.0 million per year for the 1990-95 period.

The results for each series show a tendency for the amount of household growth to be relatively stable over the projection period. Each series of projections implies a decline in the annual rate of increase of households over the next 17 years.

## HOUSEHOLDS BY TYPE

Husband-wife households made up about 62 percent of all households in 1978 (table C). In the projections for the year 1995, husband-wife households range from 52 percent of all households (Series A) to 60 percent (Series D). Households
consisting of a person living alone or householders living with nonrelatives only (nonfamily households) accounted for 25 percent of all households in 1978; in 1995, the number of nonfamily households is'expected to range from 27 percent of all households (Series D) to 32 percent (Series A). At the present time about nine-tenths of all nonfamily households are one-person households.

Nonfamily households would constitute about 30 percent of all households in 1995, but they would account for between about 32 percent (Series D) and 52 percent (Series C) of the total increase in households for the 1978-95 period. On the other hand, husband-wife households would constitute from about one-half to three-fifths of all households in 1995, whereas the increase in the number of husband-wife households between 1978 and 1995 would range from 26 percent (Series C) to 52 percent (Series D) of the total increase.

## HOUSEHOLDS BY AGE OF HOUSEHOLDER

From 1970 to 1978, much of the increase in the number of households was concentrated within two broad age groups: households with the householder under 35 years of age ( 55 percent of the total growth) and households with householders 65 years and over ( 22 percent). (The householder is the person maintaining the household and was formerly referred to as the head of household. See the section "on definitions of terms.) The increase in households with a householder 65 years old and over is largely a function of the increase in the number of aged persons and the tendency for
more eiderly persons to continue to maintain their own homes after their families have dissolved. The increase in households with householders 25 to 34 years old in the $1970-78$ period reflects the movement into young adult (household forming) ages of the large "baby boom" birth cohorts born between the mid-1940's and early 1950's. Over the next 17 years, the movement into adult ages of persons born in the high fertility years of the 1940's and 1950's will cause the major portion of the projected increase in the number of households from 1978 to 1995 to occur for households with householders between the ages of 35 and 54 years (table F).

## Table F. Estimated Average Annual Increase in the Number of Households, by Age of Householder from 1970 to 1978 and Projections from 1978 to 1985, 1985 to 1990, and 1990 to 1995

| (In thousands. Reference date is July 1 , except as noted. Minus sign ( - ) denotes net decrease) |

[^1]
## AVERAGE SIZE OF HOUSEHOLDS AND FAMILIES

In March 1978, the average number of persons per household was 2.81 , and the aver age per family was 3.33. Table 3 shows projections of the average size of households and families for 1 the years from 1978 to 1995 . The 1995 average household size ranges from 2.72 (household Series D in combination with population projection Series 1) to 2.21 (household Series $A$ in combination with population projection Series III). Average family size ranges from 3.27 to 2.74 . All series
show a continuation of the decline in household and family size that has occurred since 1965. The decline is due, in part, to the fall in the birth rate, which is directly reflected in a decrease of average number of persons under 18 years old, and also to the increase in the proportion of adults who live alone.

## METHODS AND ASSUMPTIONS

Population. The projections of the number of households and families shown in this report are based on the Series II population projections that were published in Current

Population Reports, Series P-25, No. 704 (July 1977). Only one series of population projections was used because, even in 1995, the various series of population projections differ only in the age cohort under 19 years old.

The projections of average household and family size involve the use of projections of population for persons of all ages. For this reason, separate figures have been calculated on the basis of Series I, II, and III population projections; the latter essentially reflect different assumptions about the number of future births.

The population projections used in preparing the projections of households shown in this report include members of the Armed Forces in the United States living off post or with their families on post, and exclude members of the Armed Forces abroad and members of the Armed Forces living in the United States in military barracks and similar quarters. To derive this population, the number of Armed Forces (residing in the United States and abroad) for July 1, 1977 was subtracted from the total population for all years of the projection period, and the number of Armed Forces included in the Current Population Survey (CPS) for March 1, 1978 was added back in for all years of the projection period. This calculation was carried out before the specific calculations to develop projections of the number of households. Table G presents the number of Armed Forces subtracted from the total population, including Armed Forces abroad, used in preparing the projection of households.

Table G. Number of Armed Forces Members Excluded from the Total Population Used in Preparing Household Projections, by Age and Sex
(In thousands)

| Age | Male | Female |
| :---: | :---: | :---: |
| Total, all ages. | 1,140 | 118 |
| 17 years. | 31 | 1 |
| 18 and 19 years. | 266 | 17 |
| 20 to 24 years | 506 | 64 |
| 25 to 29 years. | 156 | 25 |
| 30 to 34 years. | 94 | -6 |
| 35 to 44 years. | 86 | 3 |
| 45 to 54 years. | - | 1 |
| 55 to 64 years | 1 | - |

Current Population Survey data for 1964 through 1978 were utilized in preparing the marital status and householder proportions used in these projections. In order to make the data from each survey comparable, the category 'secondary families in group quarters" had to be modified for some years. Prior to 1968 , related persons living in group quarters were considered as members of secondary families. However, the number of such families became so small that, beginning with CPS data in 1968, persons in these families were included in the count of secondary individuals. Therefore, before any marital status or householder proportions were developed from the survey data for the years 1964 to 1967, secondary family members in group quarters were designated secondary individuals in group quarters.

The population used in preparing the household projec. tions also includes estimates of inmates of institutions. The estimates of inmates implied in the projections of population were determined by applying age-specific proportions of inmates, developed from 1970 census data, to the projected population, by age and sex. These age-specific proportions of inmates were thus assumed to remain constant after April 1, 1970. It was decided to include inmates in the projections; they had been included in the CPS prior to 1972, but not between 1972 and 1978. In order to provide a comparable series of data for use in making the projections, the number of inmates (estimated as described above) and the distribution of inmates by marital status (developed by using the percent distribution of inmates at each age by marital status from the 1970 census) was estimated for 1972 through 1978 and added into the CPS population.

Marital status and household projections. The next stage in the preparation of the projections of households and families was to project the proportions of persons in two marital status groups (single and ever married) and the proportion of persons who are householders and of persons in other relevant categories of household relationship and family status. The proportions used are itemized below in the section, "Steps involved in making household projections."

Series A, B, and D. For projection Series A, B, and D, the proportions were projected from observations developed from CPS data on the age, sex, and marital status distributions of the population for March 1 of each year 1964 through 1978.

The marital status and householder proportions were projected as follows: Each marital status and household series for years, $t=1964,1965, \ldots, 1978$, was fitted to a model of the form

$$
\begin{equation*}
\log _{e}\left(x_{t}\right)=a_{o}+a_{1} t^{*}, t^{*}=t-1963 \tag{1}
\end{equation*}
$$

using a weighted least squares procedure. This model is equivalent to fitting a straight line to the logarithms of the proportions, i.e., to fitting an exponential curve (with continuous compounding) to the original proportions. The model in (1) was used to obtain the projected value for 1995, $\hat{x}_{1995}$, when the estimate of $a_{1}$ was negative. When the estimate of $a_{1}$ was positive, it was necessary to use an alternative model to insure that the projected proportion $\hat{x}_{1995}$, was between 0 and 1. The alternative model, again fitted using weighted least squares, was

$$
\begin{equation*}
\log _{e}\left(1-x_{t}\right)=a_{0}+a_{1} t^{*}, t^{*}=t-1963 \tag{2}
\end{equation*}
$$

In this case a straight line was fitted to the logarithms of the complements of the proportions. This is equivalent to fitting an exponential curve (with continuous compounding) to the 1 complements of the original proportions. If the estimate of $a_{1}$ in (2) was also positive, the model which had the smaller estimated value for $a_{1}$ was used to obtain $\hat{x}_{1995}$, the projected proportion for 1995.

After the projected values for 1995, $\hat{x}_{1995}$, were obtained for each series of marital status and household proportions using model (1) or (2), the projections for the intervening years were obtained by linear interpolation of the logarithms of the values for 1978 and 1995. More specifically, the intervening proportions were obtained from the following formula:

$$
\begin{gathered}
\log \hat{x}_{1978+i}=\log x_{1978}+\frac{i}{17}\left(\log \hat{x}_{1995}-\log x_{1978)},\right. \\
i=1,2, \ldots 16
\end{gathered}
$$

The projected marital status and household proportions obtained by the procedure described were used in household Series B. The projected proportions used in household Series $A$ and household Series D were weighted averages of the Series B proportions and the 1978 observed proportions. The weights were chosen in order to provide an adequate range of possibilities for variation of the projected proportions around those used in Series B. The weights used to obtain the Series D proportions were $1 / 3$ for the Series B proportions and $2 / 3$ for the 1978 proportions; to derive Series $A$, the weights were $4 / 3$ for Series B proportions and $1 / 3$ for the 1978 proportions.

Series C. The marital status and household proportions in this series were also projected using the models described above in (1) or (2); however, values for 1980 and 1995 were obtained in two separate stages.

The first stage utilized data for the years 1974 through 1978 to obtain the projected value for 1980 using the models in (1) or (2). The projected value for 1979 was obtained by linear interpolation of the logarithms of the values for 1978 and 1980.

The second stage utilized data for the years 1966 through 1980 (1966 through 1978 from the CPS, 1979 and 1980 from the first stage described in the preceding paragraph) to obtain the projected value for 1995 using the models in (1) or (2). The projected values for 1981 through 1994 were obtained by linear interpolation of the logarithms of the values for 1980 and 1995.

Another series, household Series K, was based on the assumption that the levels of the mârital status and householder proportions observed in 1978 would continue unchanged to 1995 allowing only for changes in the age structure of the adult populations. This series was prepared for analytical purposes and is not considered one of the principal series.
Effect of population growth. These projections suggest that the future growth in the number of households in the United States will be determined primarily by the growth of the adult population. The effect of the growth of the adult population on the increase in the number of households may be measured by comparing the increase in the number of households in the principal projection series $(A, B, C, D)$ with the increase shown in Series K. In the latter series, all the marital status and household proportions are held constant at 1978 levels; hence, the increase in the number of households is attributable to changes in the population only and is not affected by changes in the rate of household formation.

In the four series of projections that assume changes in rates of household formation, A, B, C, and D, population growth accounts for 67 percent (Series A) to 90 percent (Series D) of the increase in the number of households from 1978 to 1985 and for 50 percent (Series A) to 82 percent (Series D) of the increase in the number of households from 1985 to 1995 (table H). Over the whole projection period, the corresponding figures are 57 percent and 86 percent.

Table H. Projected Increase in the Number of Households, by Components from 1978 to 1995
(In thousands)

| Year or period | Series |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | A | B | C | D | K |

| Population growth................... | 8,830 | 8,830 | 8,830 | 8,830 | 8,830 |
| Change in household proportions..... | 8,993 | 6,461 | 6,850 | 1,957 | - |

[^2]Steps involved in deriving household projections. A detailed outline of steps taken in calculating the number of households and families for each year of the projection period is given below. The data were prepared by use of data for the following age groups: 14 to 17,18 and 19,20 to 24,25 to 29,30 to 34,35 to 44,45 to 54,55 to 64,65 to 74,75 and over.

## Males, by age:

1. Record male population consistent with CPS coverage for future years (assuming no coverage changes).
2. Record projected proportion single among male population.
3. Calculate number of single men (item 1 times item 2).
4. Calculate number of ever-married men (item 1 minus item 3).
5. Record projected proportion married with wife present, among evermarried men.
6. Calculate number of married men with wife present (item 4 times item 5).
7. Prepare adjusted number of married men with wife present. (The total number of married men with wife present from item 6 was averaged with the number of married women with husband present from item 32 , for each year; this average became the new total number of married men with wife present, and numbers by age groups were adjusted pro rata to agree with the new total.)
8. Record projected proportion with own household among married men with wife present, that is, householders in husband-wife households.
9. Calculate number of husband-wife households (item 7 times item 8).
10. Calculate number of married men with wife present, without own household (item 7 minus item 9).
11. Record proportion who are inmates of institutions (age-specific proportions derived from estimates of the number of inmates of institutions for April 1, 1970 held constant).
12. Calculate number of inmates of institutions (item 1 times item 11).
13. Calculate number of male nonimates, not "married, wife present" (item 1 minus item 7 minus item 12).
14. Record projected proportion of family householders among male noninmates, not "married, wife present."
15. Calculate number of family householders not "married, wife present" (item 13 times item 14).
16. Record projected proportion of nonfamily householders among male noninmates, not "married, wife present."
17. Calculate number of male nonfamily householders (item 13 times item 16).
18. Record proportion husband-wife secondary family husbands among married men with wife present, without own household (3-year average centered on 1977 held constant).
19. Calculate number of husband-wife secondary family husbands (item 10 times item 18).
20. Record ratio of all secondary families to husband-wife secondary families ( 3 -year average centered on 1977 held constant).
21. Calculate number of all secondary families litem 19 times item 20).
22. Calculate number of male nonimates not "married, wife present," not householders (item 13 minus item 15 minus.item 17).
23. Record projected proportion secondary individuals among male noninmates, not "married, wife present," not householders.
24. Calculate number of male secondary individuals (item 22 times item 23).
25. Record projected proportion secondary individuals in group quarters among male secondary individuals.
26. Calculate number of male secondary individuals in group quarters (item 24 times item 25).
Females, by age:
27. Record female population consistent with CPS coverage for future years.
28. Record projected proportion single among female population.
29. Calculate number of single women (item 27 times item 28).
30. Calculate number of ever-married women (item 27 minus item 29).
31. Record projected proportion married with husband present, among ever-married women. ,
32. Calculate number of married women with husband present (item 30 times item 31).
33. Prepare adjusted number of married women with husband present. (The total number of married men with wife present from item 6 was averaged with the number of married women with husband present, from item 32, for each year; this average became the new total number of married women with husband present, and numbers by age groups were adjusted pro rata to agree with the new total.)
34. Record proportion who are inmates of institutions (age-specific proportions derived from estimates of the number of inmates of institutions for April 1, 1970 held constant).
35. Calculate number of inmates of institutions (item 27 times item 34).
36. Calculate number of female nonimates, not "married, husband present" (item 27 minus item 33 minus item 35.)

337
Record projected proportion of family householders among female nonimates, not "married, husband present."
38. Calculate number of female family householders, no husband present (item 36 times item 37).
39. Record projected proportion of nonfamily householders among female noninmates, not "married, husband present."
40. Calculate number of female nonfamily householders (item 36 times item 39).
41. Calculate number of female noninmates, not "married, husband present," not householders (item 36 minus item 38 minus item 40).
42. Record projected proportion secondary individuals among female noninmates, not "married, husband present," not householders.
43. Calculate number of female secondary individuals (item 41 times item 42).
44. Record projected proportion secondary individuals in group quarters among female secondary individuals.
45. Calculate number of female secondary individuals in group quarters (item 43 times item 44).
The following is a summary of item numbers corresponding to the projections of the various types of family units and their members:

Family unit

## Item numbers

All households. . . . . . . Sum of $9,15,17,38,40$
Family households
Sum of $9,15,38$
Husband-wife 9
Male householder, no
wife present 15
Female householder, no husband present . ..... 38
Nonfamily households .... Sum of 17,40
Male
17
Female 40

All families
Sum of $9,15,21,38$
Husband-wife
Sum of 9,19
Other
Sum of $15,(21$ minus 19), 38
Married couples ...... 7
With own household ....... 9
Without own household ... 10
All unrelated
individuals
Sum of $17,24,40,43$
Nonfamily householders.
Sum of 17,40
Secondary individuals . . . . .

For purposes of preparing the average size of households and families shown in table 3, the population 14 years old and over in these units was prepared as follows:

1. Househoid population:

Male: Item 1 minus sum of items 12,26
Female: Item 27 minus sum of items 35,45
2. Family population:

Male: Item 1 minus sum of items $12,17,24$
Female: Item 27 minus sum of items $35,40,43$
The population under 14 years old in households and families was obtained by applying in-household proportions developed from the 1970 census to the population under 14 in projection Series I, II, and III (Series P-25, No. 704).

## DEFINITIONS OF TERMS

A household includes all the persons who occupy a house, an apartment or other group of rooms, or a room, which constitutes a housing unit under the 1970 census rules. A person living alone or a group of 5 or fewer unrelated persons sharing the same housing unit as partners is counted as a household. The number of households is, by definition, the same as the number of occupied housing units.

Persons who are not members of households are classified under the 1970 census rules as living in group quarters. These quarters include institutions, large rooming houses, convents, staff quarters in hospitals, etc.

One person in each household is designated as the householder. Through March 1978, the householder in the CPS has usually been the person regarded as the "head of the household" by the members of the household; however, married men were classified as heads or householders if their wives were living with them at the time of the survey. Beginning with the 1979 CPS, the concept 'head of household" has been dropped from Census Bureau use in asking questions about household relationship. Relationship is now asked on the basis of identifying one of the household members in whose name the home is owned or rented and determining the relationship of all other household members, if any, to the owner-renter reference person. The household reference person will be shown in data presentations as the "householder." The results of several tests indicate that in future years, only a minimal amount of comparability with historical data on type of households will be lost.

Within households, persons who are family members are distinguished from those who are not family members. A family is defined as a group of two or more persons residing together who are related by birth, marriage, or adoption; all such persons are considered as members of one family even though they may include a "subfamily," that is, a married couple or a parent-child group related to, but not including, the householder and sharing the living quarters of the householder. A family household includes among its members the householder, and all household members who are related to the householder. A "secondary family" includes no members related to the householder. Members of
secondary families may include persons such as lodgers or resident employees and their relatives living in a household.

Persons who are not family members (that is, are not living with any relatives) include "unrelated individuals" and inmates of institutions. An unrelated individual who is a householder is classified as a "nonfamily householder," that is, a householder with no relatives in the household. An unrelated individual who is not a householder is a "sečondary individual," that is, a roomer, hotel guest, resident employee, etc., with no relatives in the household or group quarters.

Inmates of institutions are persons, other than resident employees, residing in such places as homes for delinquent or dependent children, homes and schools for the mentally or physically handicapped, places providing specialized medical care, homes for the aged, prisons, and jails.

The marital status classification identifies two major categories: single (never married) and ever married. The latter category is subdivided into married, spouse present, and other ever married.

A person is classified as "married, spouse present" if his or her spouse is a member of the same household even though the person may be temporarily absent on business or on vacation, visiting, in a hospital, etc.

The category "other ever married" includes separated, "other married, spouse absent," widowed, and divorced persons. Persons classified as separated include those with legal separations, those living apart with intentions of obtaining a divorce, and other persons permanently or temporarily separated because of marital discord. The group "other married, spouse absent" includes married persons living apart because either the husband or wife was employed and living at a considerable distance from home, was serving away from home in the Armed Forces, was residing in an
institution, had moved to another area, or had a different place of residence for any other reason except separation as defined above.

## RELATED REPORTS

The projections published in this report are designed as extensions of the data based on the CPS shown in Current Population Reports, Series P-20. The coverage of the projections is essentially the same as that for the reports on marital status and household and family characteristics based on the CPS with the major exception that the institutional population is included in the projections, as it was in CPS data prior to 1972. The data apply to the resident population -of the United States, except that members of the Armed Forces living in barracks and similar quarters are excluded. Data for years prior to 1960 exclude Alaska and Hawaii. Here, as in the CPS, single persons away from home in college dormitories are included as members of their families at their home; in the decennial census these persons are included in the group quarters population as secondary individuals at the dormitories where they live while attending college.

The population projections used in preparing this report are shown in Current Population Reports, Series P.25, No. 704.

## ROUNDING OF ESTIMATES

Figures presented in this report have been rounded to the nearest thousand without being adjusted to group totals which are independently rounded; hence, the sum of the parts may differ slightly from the totals shown.

Table 1. Estimates of Household and Family Units, by Type for 1978 and Projections from 1979 to 1995
In thousands. Reference date is July 1 , except as noted. Series $k$ is an analytical series designed to show the effects of population change alone, with marital status and householder proportions held constant in future years. See text for explanation of series)
