Population Estimates and Projections

Series P-25, No. 922
Issued October 1982

Projections of the Population of the United States: 1982 to 2050 (Advance Report)

This report presents U.S. population projections by age, race, and sex for 1982 to 2050. These are based on the July 1, 1981, population estimates and race definitions, and are projected forward using a cohort-component method with alternative assumptions on fertility, mortality, and net immigration levels. The series using the middle assumptions for each of the three components is designated as the "middle" series.

Fertility rates are assumed to remain fairly steady, increasing slightly from 1.83 births per woman in 1980 to 1.96 in 2000 and then decreasing to 1.90 births per woman in 2050.

Life expectancy for females is assumed to rise from 78.3 in 1981 to 81.3 in 2005 and 83.6 years in 2050.

Life expectancy for males also is assumed to rise from 70.7 in 1981 to 73.3 in 2005 and 75.1 years in 2050.

Net immigration is assumed to be a constant 450,000 a year.

Under the middle series the growth rate of the U.S. population is projected to slow gradually with the following projected consequences.

The annual rate of population growth would slow from .9 percent in 1981 to .6 percent in 2000 and will reach virtually zero population growth by 2050.

The total U.S. population would increase from 230 million in 1981 to 268 million in 2000. The population will reach an all-time high of 309 million in 2050 before beginning to decline.

The total number of yearly births would climb from 3.6 million in 1981 to 3.9 million in 1988 before declining. Under these projections the U.S. population would never again reach the 4 million births attained annually during the height of the baby boom.

- Despite increasing life expectancies, the older age structure would cause the total number of deaths to increase from 2.0 million in 1981 to 3.6 million in 2035. From that time forward, the number of deaths will exceed the number of births and will be over 3.9 million by 2050.
- While the rate of natural increase is projected to be negative after 2035, net immigration results in a growing population until 2050, after which the population would start to decline.

These changing components of population growth would lead to marked changes in the age and race distribution of the population during the next 70 years.

- The percentage of the population aged 65 and over would rise from 11.4 percent in 1981 to 13.1 percent in 2000 and 21.7 percent in 2050.
- The percentage of the population aged 85 and over would rise from 1.0 percent in 1981 to 1.9 percent in 2000 and 5.2 percent in 2050.
- The population of primary-school age (5 to 13 years) would decrease from 30.7 million 1981 to 29.6 million in 1985 after which it would increase to 34.4 million by 1995.
- The population of secondary-school age (14 to 17 years) would decline from 14.9 million in 1981 to 12.9 million in 1990 before increasing to 15.4 million in 2000.
- The population of 18-and-19-year-olds, the prime group entering the labor force, college, and the Armed Forces, would decline from 8.5 million in 1981 to 6.5 million in 1995 before rising slowly to 7.5 million in 2000.
- The population of young adults aged 25 to 34 would increase briefly from 39 million in 1981 to 44 million in 1990 before declining to 36 million in 2000.

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Postage stamps not acceptable; currency submitted at sender's risk. Remittances from foreign countries must be by international money order or by a draft on a U.S. bank. Current Population Reports are sold in two subscription packages: Series P-20, P-23, P-27, and P-60 are available for \$90 per year (\$22.50 additional for foreign mailing); Series P-25, P-26, and P-28 are available for \$22 per year (\$5.50 additional for foreign mailing). The single-copy price of this report is \$2.75.

Bureau of the Census
Tokorozawa

- Overall, the U.S. population would grow substantially older with the median age increasing from 30.3 years in 1981 to 36.3 years in 2000 and 41.6 years in 2050.
- The percentage of the population that is Black is projected to increase from 11.9 percent in 1981 to 13.4 percent in 2000 and 16.8 percent in 2050.

ALTERNATIVE PROJECTIONS

The preceding results are all based on the middle series, assuming the middle levels of fertility, mortality, and immigration. The nature of population growth is such that the actual future course of population size could vary considerably from the middle projection because of variations in fertility, mortality, and immigration. To give an approximate idea of the possible range of these projections, several tables in this report also show the series with the lowest total population (low fertility, high mortality, and low immigration) and the series with the highest total population (high fertility, low mortality, and high immigration). The range for population projections between the lowest and highest series is from 256 million to 282 million in the year 2000 and from 231 million to 429 million in 2050. The effects of changing each component separately are also shown by varying each of the fertility, mortality, and immigration components around the middle series.

- Alternative fertility assumptions make the largest difference of any component with a population of 257 million in 2050 under the lowest fertility assumption of 1.6 births per woman and a population of 379 million under the highest fertility assumption of 2.3 births per woman.
- Alternative mortality assumptions make the smallest difference of any component with a 2050 population of 298

million under the high mortality assumption (ultimate life expectancy at birth of 76.5 years) and a 2050 population of 322 million under the low mortality assumption (ultimate life expectancy of 83.3 years).

- Alternative net immigration assumptions could make a substantial difference with low net immigration (250,000 a year) leading to a population of 291 million in 2050, while high net immigration (750,000 a year) would result in 340 million in 2050.

METHODOLOGY AND ASSUMPTIONS

These projections were prepared using the cohort-component method in which the components of population change (births, deaths, and net immigration) are projected separately for each birth cohort (persons born in each year). The base population (July 1, 1981) is carried forward year by year using projected survival rates and net immigration by single year of age, sex, and race. Each year a new birth cohort of persons under age 1 is added to the population by applying projected age-specific fertility rates to the surviving female population.

The principal assumptions for each of the series presented in this report are shown in table A. For each component (fertility, mortality, and immigration), a middle assumption representing the likely future course of the component was selected along with a reasonable range around each component to provide high and low assumptions.

Fertility in the middle series was assumed to reach an ultimate completed cohort fertility of 1.9 births per woman. This was consistent with recent levels of fertility, women's expectations of future births, and social and economic trends leading to lower fertility—increases in labor force participation, educational attainment, and age at first marriage. For the low and high assumptions, levels of 1.6 and 2.3 births per woman were chosen. The ultimate timing pattern of fertility

Table A. Projected Series, by Principal Fertility, Mortality, and Migration Assumptions

Series	Fertility assumption (ultimate life-time births per woman)	Mortality assumption (life expectancy in 2050)	Immigration assumption (yearly net immigration in thousands)
Middle.....	1.9	79.6	450
Highest.....	2.3	83.3	750
Lowest.....	1.6	76.7	250
High fertility.....	2.3	79.6	450
Low fertility.....	1.6	79.6	450
High mortality.....	1.9	76.7	450
Low mortality.....	1.9	83.3	450
High immigration.....	1.9	79.6	750
Low immigration.....	1.9	79.6	250
Zero immigration.....	1.9	79.6	0

was derived by assuming an ultimate mean age at childbearing of 26.5 in conjunction with slightly modified recent fertility experiences of birth cohorts of White women. These ultimate levels were assumed to be attained by the 1985 birth cohort for White and other races and by the calendar year 2050 for Blacks.

Mortality was projected to decline under all three assumptions. The middle assumption was consistent with projections done by the Social Security Administration in which rapid declines in mortality rates were projected to the year 2005. After that time, mortality rates decrease more slowly so that White and other races reach an ultimate life expectancy of 79.8 in 2050. The low mortality assumption projects even faster declines in mortality with total life expectancy reaching 83.3 in 2050. Even under the high mortality assumption, life expectancy increases to 76.7 by 2050. Since declines in the mortality rates for Blacks have historically lagged behind White mortality declines, the life expectancy of the Black population is projected to reach the ultimate level in 2080.

The middle set of immigration projections uses an assumption of a constant annual net inflow of 450,000—roughly equal to the measured level of net annual immigration over the past decade. A wide range between the high and low

assumptions of net immigration is needed given the uncertainty as to the future course of refugee movements, possible changes in immigration legislation over the next 70 years, and the lack of adequate data on the legal flows of emigrants from the United States and the flows of undocumented aliens into and out of the United States. The high assumption of 750,000 can accommodate most of these concerns. The low assumption of 250,000 assumes little or no undocumented migration to the United States and a substantial outmigration of both aliens and citizens from the United States.

The race definitions used in this report conform to the race definitions used in vital statistics procedures after 1978 and with the postcensal estimates for 1980 and 1981. For a detailed treatment of the differences between these results and the 1980 census definitions of race, see Current Population Reports, Series P-25, No. 917, pp. 6-7.

This advance report will be followed by a version showing considerably more detail—both in the projection results and in the description of methodology and assumptions. There may be slight revisions in the projected numbers in the detailed report based on the inclusion of more recent estimates of the population and its components of change.
