Market Absorption of Apartments

Second Quarter 1986 – Absorptions
(Completions in First Quarter 1986)

H130-86-Q2
Issued September 1986

Questions regarding these data maybe directed to Charles Clark, Housing Division, Telephone 301-763-2866.

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Postage Stamps not acceptable; currency submitted at sender's risk. Remittance from foreign countries must be by international money order or by draft on a U.S. bank. \$11 per year. Additional charge for foreign mailing, \$2.75. Single copy \$2.50.

SUMMARY OF FINDINGS

Privately financed, nonsubsidized, unfurnished apartments completed during the January-March 1986 quarter were 67 percent absorbed (seasonally adjusted) 3 months after their completion. This is about the same as the 3-month seasonally adjusted rate for apartments completed during the fourth quarter of 1985. Apartments which have been on the market for 9 months, those completed during July-September 1985, were 91 percent absorbed.

The data are based on a sample survey and consequently the figures cited above are subject to sampling variability. As shown in table 3, the 67 and 91 percent figures are subject to sampling errors (i.e., standard errors) of 1.7 and 1.1 percentage points, respectively. This means that there are about 2 chances out of 3 that a complete count would be in the range of 67 (± 1.7) percentage points and 91 (± 1.1) percentage points. Sampling errors for the figures that follow are indicated in parenthesis.¹

A total of 123,400 ($\pm 7,220$) apartments were completed during the first quarter of 1986. The number of privately financed, nonsubsidized, unfurnished apartments completed was 92,500 ($\pm 3,440$), about 75 (± 2.6) percent of total apartment completions during the quarter. This is not significantly different from the number of similar apartments completed in the fourth quarter of 1985, but represents an increase of about 24 (± 6.3) percent over completions of unfurnished units in the first quarter of 1985.

The median rent asked for newly constructed units was \$441 (± 5.2) in the first quarter of 1986. Apartments renting for less

than \$300 accounted for 7 (± 0.9) percent of total completions. Apartments renting for \$300 to \$399, \$400 to \$499, and \$500 or more each accounted for about one-third of total completions with 29 (± 1.7), 34 (± 1.7), and 31 (± 1.7) percent, respectively. Approximately 51 (± 1.8) percent of the newly constructed apartments were built with two bedrooms and about the same, 47 (± 1.8) percent, had less than two bedrooms. Only 3 (± 0.6) percent were built with three or more bedrooms.

The total number of unfurnished units completed in the last 12 months reported as rented in the second quarter of 1986 was 91,800 ($\pm 5,480$). The median rent asked for these units was \$440 (± 5.0). The total number of similar apartments remaining for rent at the end of the second quarter was 62,500 ($\pm 4,670$) with a median asking rent of \$451 (± 12.5).

Approximately 23,600 ($\pm 2,830$) cooperative and condominium apartments were completed in the first quarter of 1986. This represents a decrease of about 28 (± 12.3) percent from first quarter 1985 completions. Cooperative and condominium apartments accounted for about 19 (± 2.3) percent of total first quarter 1986 completions. The 3-month absorption rate for cooperative and condominium apartments was 76 (± 5.1) percent. The median price asked for condominium units was \$86,600 ($\pm 4,100$). The majority of newly constructed condominium apartments, 74 (± 5.3) percent, had 2 bedrooms. Condominium apartments with less than two bedrooms accounted for 14 (± 4.2) percent of the total while those with three bedrooms or more were about the same at 11 (± 3.8) percent.

The total number of condominium apartments completed in the last 12 months reported as sold in the second quarter of 1986

¹See Reliability of Estimates on page 5.

Figure 2.
**Median Rent of Apartments Completed in
 the United States: 1983 to 1986**

Note: Limited to buildings with five or more units in permit-issuing places.

Figure 3.
**Cooperative and Condominium Apartment Completions as Percent of
 Total Apartment Completions: 1983 to 1986**

Note: Limited to buildings with five or more units in permit-issuing places.

was 27,900 (\pm 3,240). The median price asked for these units was \$91,100 (\pm 4,290). The total number of condominium apartments remaining for sale at the end of the second quarter was 21,500 (\pm 2,850) with a median asking price of \$94,400 (\pm 5,530).

Units in federally subsidized properties built under programs of the Department of Housing and Urban Development (Low Income Housing Assistance (Section 8), Senior Citizens Housing Direct Loans (Section 202), and all units in buildings containing apartments in the FHA rent supplement program) accounted for only 4 (\pm 1.0) percent of total completions.

Furnished rental units accounted for 1 (\pm 0.5) percent of apartment completions. The remaining units, 1 (\pm 0.5) percent, are not in scope of the survey and include time-sharing units, continuing care retirement units, and turnkey housing (privately built for and sold to local public housing authorities subsequent to completion). The data on privately financed units include privately owned housing subsidized by State and local government.

SAMPLE DESIGN

The Survey of Market Absorption (SOMA) is designed to provide data concerning the rate at which nonsubsidized and unfurnished privately financed units in buildings with five or more units are rented (or absorbed). In addition, data on characteristics of the units, such as rent and number of bedrooms, are collected.

The buildings selected for SOMA are those included in the Census Bureau's Survey of Construction (SOC)². For this survey, the United States is first divided into primary sampling units (PSU's) which are sampled on the basis of population. Next, a sample of permit-issuing places is selected within each sample PSU. Finally, all buildings within sampled places with five or more units as well as a subsample of buildings with one to four units are selected.

Each quarter, a sample of buildings with five or more housing units in the SOC sample reported as completed during that quarter come into sample for SOMA. Buildings completed in nonpermit-issuing areas are excluded from consideration. Information on the proportion of units absorbed 3, 6, 9, and 12 months after completion is obtained for units in buildings selected in a given quarter in each of the next four quarters.

Each quarter the absorption data for some buildings are received too late for inclusion in the report. These late data will be included in a revised table in the next quarterly report. (See table 2.)

ESTIMATION

Unbiased quarterly estimates are formed by multiplying the counts for each building by its base weight (the inverse of its

²See "Housing Starts," Construction Reports, Series C20, for details of this survey.

*Standard error within range of about 2 chances out of 3. (X) Not applicable.

probability of selection) and then summing over all buildings. The final estimate is then obtained by multiplying the unbiased estimate by the following ratio estimate factor:

$$\frac{\text{total units in 5 + buildings in permit-issuing areas} \\ \text{as estimated by the SOC} \\ \text{for that quarter}}{\text{total units in 5 + buildings as estimated by SOMA} \\ \text{for that quarter}}$$

This procedure produces estimates of the units completed in a given quarter which are consistent with the published figures from the Housing Completions Series,³ and also reduces, to some extent, the sampling variability of the estimates of totals.

It is assumed that the absorption rates and other characteristics of units not included in the interviewed group or not accounted for are identical to rates for units where data were obtained. The noninterviewed and not-accounted-for-cases constitute less than 2 percent of the sample housing units in this survey.

RELIABILITY OF THE ESTIMATES

There are two types of possible errors associated with data from sample surveys: sampling and nonsampling errors. The

following is a description of the sampling and nonsampling errors associated with SOMA.

Nonsampling Errors

In general, nonsampling errors can be attributed to many sources: inability to obtain information about all cases, definitional difficulties, differences in the interpretation of questions, inability or unwillingness to provide correct information on the part of respondents, mistakes in recording or coding the data, and other errors of collection, response, processing, coverage, and estimation for missing data.

Sampling Errors

The particular sample used for this survey is one of a large number of possible samples of the same size that could have been selected using the same sample design. Even if the same questionnaires, instructions, and interviewers were used, estimates from each of the different samples would differ from each other. The deviation of a sample estimate from the average of all possible samples is defined as the sampling error. The standard error of a survey estimate attempts to provide a measure of this variation among the estimates from the possible samples and, thus, is a measure of the precision with which an estimate from a sample approximates the average result of all possible samples.

^FRevised.

As calculated for this survey, the standard error also partially measures the variation in the estimates due to response and interviewer errors (nonsampling errors), but it does not measure, as such, any systematic biases in these data. Therefore, the accuracy of the estimates depends on both the sampling and nonsampling error measured by the standard error, biases, and some additional nonsampling errors not measured by the standard error.

The sample estimate and its estimated standard error enable the user to construct confidence intervals, ranges that would include the average result of all possible samples with a known probability. For example, if all possible samples were selected, each of these were surveyed under essentially the same general conditions, and an estimate and its estimated standard error were calculated from each sample, then—

1. Approximately 68 percent of the intervals from one standard error below the estimate to one standard error above the estimate would include the average result of all possible samples.
2. Approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples.
3. Approximately 95 percent of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average result of all possible samples.

For very small estimates, the lower limit of the confidence interval may be negative. In this case, a better approximation to the true interval estimate can be achieved by restricting the interval estimate to positive values, that is, by changing the lower limit of the interval estimate to zero.

The average result of all possible samples either is or is not contained in any particular computed interval. However, for a particular sample, one can say with specified confidence that the average result of all possible samples is included in the constructed interval.

The conclusions stated in this report are considered significant at the 95 percent confidence level.

For example, table 1 of this report shows that there were 46,800 apartments with two bedrooms in the first quarter of 1986. The standard error of this estimate is 3,610. The 68 percent confidence interval as shown by these data is from 43,190 to 50,410. Therefore, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. Similarly, we could conclude that the average estimate derived from all possible samples lies within the interval from 39,580 to 54,020 (using twice the standard error) with 95 percent confidence.

The data in this report are preliminary and subject to slight changes in the annual report.

At what rate are newly constructed apartments rented or otherwise absorbed?
Find the answers in these quarterly housing reports—

"MARKET ABSORPTION OF APARTMENTS"
— Series H-130

Because of the continuing interest in apartment construction throughout the Nation, both private industry and Government have a need for information on the nature of the demand for rental housing. This report is designed to provide data concerning the rate at which nonsubsidized and unfurnished privately financed units in buildings with five or more units are rented (or absorbed). The "Market Absorption of Apartments" quarterly report provides data on the time it takes to rent new apartment units by showing percents absorbed at 3-, 6-, 9-, and 12-months intervals following completion of the units. Three-month absorption rates are also presented for some characteristics of the units, such as asking rent classes and number of bedrooms. Data for cooperative and condominium apartment units, such as the total completed and the 3-month absorption rate, are also provided.

The annual report provides similar data for the geographic regions of the United States and for inside and outside SMSA's of the United States. In addition, data are presented on facilities and services offered in new rental units, such as air conditioning and swimming pools.

"CHARACTERISTICS OF APARTMENTS COMPLETED"
— Series H-131

This report provides data on the characteristics of nonsubsidized and privately financed apartment units in buildings with five or more units completed during a calendar year. For unfurnished units, the characteristics include number of bedrooms, asking rent classes, and the 3-month absorption rate. Geographically, the data are presented by regions of the United States and by inside and outside SMSA's.

For furnished units, data are presented for the United States by asking rent classes and number of bedrooms. For cooperative and condominium units, data are given for the United States by number of bedrooms, regions, and percent absorbed after 3 months.

These publications are of great value to builders, bankers, market analysts, land planners, and Government officials trying to measure the needs for Federal, State, and local assistance in providing better housing for everyone.

The statistics of these reports are based on a survey conducted by the Bureau of the Census, U.S. Department of Commerce, for the Department of Housing and Urban Development.
