

CURRENT POPULATION REPORTS

National and State
Population Estimates:
1990 to 1994

P25-1127

by Edwin Byerly and
Kevin Deardorff

U.S. Department of Commerce
Economics and Statistics Administration
BUREAU OF THE CENSUS

Acknowledgments

This report was prepared in Population Division by **Edwin Byerly** of the Population Distribution Branch and by **Kevin Deardorff** of the Population Projections Branch. The Population Estimates Branch produced the subnational data and methodology. **Tracy Merriman** provided all statistical assistance. **David Word** and **Prithwis Das Gupta** provided comments and advice. **Mary Ellen Hajmosi** provided typing assistance. Overall direction was provided by **John Long**, Assistant Division Chief.

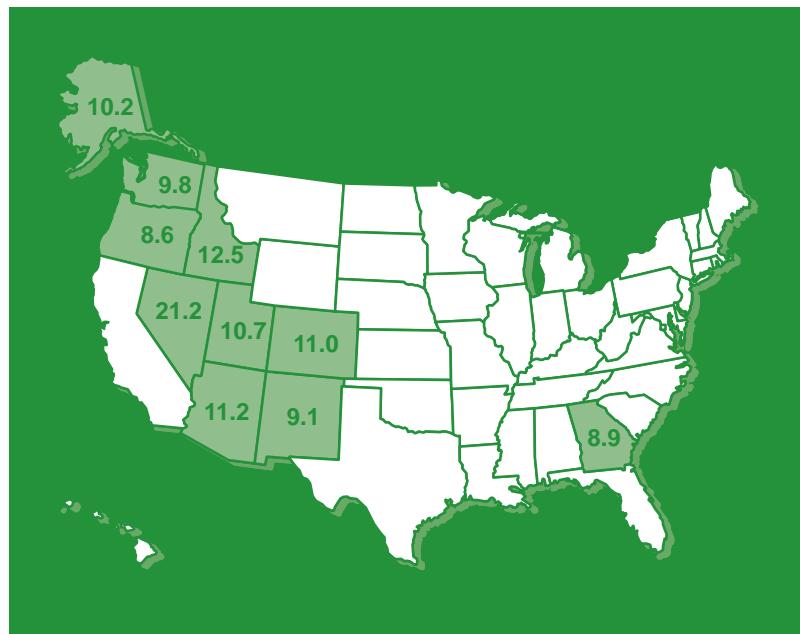

The staff of Administrative and Publications Services Division, **Walter C. Odom**, Chief, performed publication planning, design, composition, editorial review, and printing planning and procurement. **Cynthia G. Brooks** provided publication coordination and editing.

National and State Population Estimates: 1990 to 1994

NOTE TO REPORT USERS

Current Population Reports are not the only form of release for population estimates products. Newly released population estimates will typically appear first in one or more of the following three outlets:

1. Other printed media such as press releases, Census Advisories, and Population Paper Listings (PPL's)
2. On-line electronic forms such as the Internet (<http://www.census.gov>) and public bulletin board
3. Electromagnetic storage forms, such as diskettes (PE's) and a planned CD-ROM

These other media may contain additional detail not shown in the printed report.

The Population Division Statistical Information Staff (301-457-2422) or (pop@census.gov) should be the first point of contact for most questions and orders concerning population estimates. They are aware of the most recent population estimates products and will provide or direct data users to these products. A fee may be charged for the requested material.

INTRODUCTION

This report represents a synthesis of three previously separate series P25 reports:

1. An annual State estimates report, with age-sex detail and components of population change
2. An annual national level report with age-race-sex-Hispanic origin detail
3. A monthly national "boilerplate" report showing monthly estimates for three population universes

This report begins with a brief section highlighting 1990 to 1994 population trends. A separate Current Population Report presenting an analysis of subnational population distribution is planned for later this year.

The second section contains estimates methodology (with appendixes), followed by a third section of detailed tables of U.S., region, division, and State population estimates for 1990 to 1994. The population figures have been rounded to the nearest thousands without being adjusted to group totals, which are independently rounded.

The 1990 to 1994 resident U.S. and State population totals shown here were first released in December 1994 in Department of Commerce press release CB94-204. The age-sex estimates were released on March 1, 1995, in Census Advisory CB95-39.

HIGHLIGHTS

National

- On July 1, 1994, there were 260,341,000 people in the United States. This was an increase of 2.6 million persons since July 1, 1993, and an increase of 11.6 million persons since the 1990 census.
- The Nation's population growth from July 1993 to July 1994 was mostly the result of "natural increase" (4.0 million births minus 2.3 million deaths). The United States also experienced a net gain from migration of 850,000 (762,000 international migrants and 88,000 returning Federal U.S. citizens).
- For the July 1993 to July 1994 period, the Hispanic population¹ grew by 886,000 people. While the White, non-Hispanic population added 885,000 people. This marks the first time that the yearly estimated growth to the Hispanic population was numerically larger than that for the White, non-Hispanic population.
- From July 1, 1993, to July 1, 1994, the Asian and Pacific Islander population grew by 4.1 percent; the Black population grew by 1.5 percent; the American Indian, Eskimo, and Aleut population grew by 1.5 percent; and the White population grew by 0.8 percent.

Subnational

- Texas passed New York during the July 1993 to 1994 period to become the second largest State behind California.

¹Persons of Hispanic origin may be of any race. Information on the total and Hispanic population shown in this report was collected in the 50 States and the District of Columbia, and therefore, does not include residents of Puerto Rico.

- Eight of the ten fastest growing States are in the West, with Nevada growing the fastest between 1993 and 1994 at 5.4 percent.
- The South is the most populous region of the Nation, and gained the most population between 1993 and 1994.
- Connecticut, Rhode Island, and the District of Columbia lost population during the 1993-94 period.
- The West is the region with the lowest median age (32.7 years), while the Northeast region has the highest median age (35.3 years).
- Every State gained in 65 and over population, only the District of Columbia marked a decline in elderly population between 1993 and 1994.

METHODOLOGY

The methodology used to produce U.S. level estimates differs from the subnational estimates methodology, although all subnational estimates are prorated to be consistent with the national estimates.

Adjustments and Modification to the 1990 Census Base

The national and subnational population estimates are not adjusted for net underenumeration in the 1990 census. However, for the first time, they include a small increase (8,418 persons in the U.S.) in the census base population from count resolution corrections processed through March, 1994.²

Although the enumeration of resident population in the 1990 census, without adjustment for net undercoverage, was adopted as a standard for the estimates, changes were made in the distribution of the national and subnational population by age and race. These modifications were made in order to bring the definition of age and race into conformity with definitions used for data from other sources, such as vital statistics.

For age, the aim was to correct biases in census age tabulations that resulted from displacement of age reporting from the reference date of the census. In 1990 census publications, age is based on respondents' direct reports of age at last birthday, with some editing for age misstatement. This definition proved inadequate for postcensal estimates, as many respondents reported their age (even if correctly) at the time of completion of the census form or interview by an enumerator, either of which could have occurred several months after the April 1 reference date. As a result, age was biased

upward. Modification was based on a respecification of age, for most individual respondents, according to their year of birth. Age was derived from year of birth by allocating date of birth to the first quarter and last three quarters of each year, subtracting year of birth from 1990 for those born before April 1, and from 1989 for those born after April 1. The allocation was based on a historical series of registered births by month.³

For race, the specific object of the modification was to conform to the definition of race specified in Office of Management and Budget (OMB) Directive 15. In the 1990 census, a substantial number of persons (roughly 9.8 million) did not specify a racial group that could be classified as any of the White, Black, American Indian, Eskimo, Aleut, Asian, or Pacific Islander categories on the census form. A large majority of these persons were of Hispanic origin (based on their response to a separate, Hispanic origin question on the form), and many wrote in their Hispanic origin, or Hispanic origin type (for example, Mexican or Puerto Rican) as their race. Persons of unspecified race were allocated to one of the four tabulated racial groups (White, Black, American Indian, Asian and Pacific Islander) based on their response to the Hispanic origin question.⁴ These four race categories conform with OMB Directive 15 and are more consistent with the race categories in other administrative sources (such as vital statistics) than are the original census tabulations. As was the case with age modification, the procedure was carried out through assignment of modified race on individual census records.⁵

NATIONAL ESTIMATES METHODOLOGY

Population Universe

Estimates of the U.S. resident population in this report include persons resident in the 50 States and the District of Columbia. They exclude residents of the Commonwealth of Puerto Rico and residents of the outlying areas under U.S. sovereignty or jurisdiction (principally American Samoa, Guam, Virgin Islands of

³For a more detailed description of the age modification procedures, see publication CPH-L-74, *Age, Sex, and Hispanic Origin Information From the 1990 Census: A Comparison of Census Results With Results Where Age and Race Have Been Modified*. For a comparison of this procedure with procedures used for the 1980 census, see Frederick W. Hollmann, *U.S. Population Estimates by Age, Sex, Race, and Hispanic Origin: 1980 to 1991*, Current Population Reports, P25-1095.

⁴Throughout this text, "American Indian" refers to American Indian, Eskimo, and Aleut; "API" refers to Asian and Pacific Islander.

⁵For a more detailed description of the race modification procedures, see publication CPH-L-74, *Age, Sex, and Hispanic Origin Information From the 1990 Census: A Comparison of Census Results With Results Where Age and Race Have Been Modified*. For a comparison of this procedure with procedures used for the 1980 census, see Frederick W. Hollmann, *U.S. Population Estimates by Age, Sex, Race, and Hispanic Origin: 1980 to 1991*, Current Population Reports, P25-1095.

²An explanation of the 1990 census count resolution process is described in CPH-L-157, and is available from our division statistical information staff.

the United States, and Commonwealth of the Northern Mariana Islands). The definition of residence conforms to the criterion used in the 1990 census, which defines a resident of a specified area as a person "usually resident" in that area. Estimates of resident population exclude the U.S. Armed Forces overseas, as well as civilian U.S. citizens whose usual place of residence is outside the United States.

Estimates of the resident population plus Armed Forces overseas (available on request) include U.S. residents and members of the Armed Forces on active duty stationed outside the United States, but do not include military dependents and other U.S. citizens living abroad. Civilian population estimates (also available on request) include U.S. residents not in the active duty Armed Forces. The difference between resident population plus Armed Forces overseas and civilian population is the worldwide Armed Forces' population. This includes regular active duty military personnel as reported in military strength statistics of the five branches of the Armed Forces in the Departments of Defense and Transportation, reserve forces on 3- and 6-months active duty for training, National Guard reserve forces on active duty for 4 months or more, and students at the military academies.⁶ Estimates of the Armed Forces overseas generally include persons reported by their respective branch of Armed Forces as stationed outside the United States; for the Navy, they include persons ashore at overseas locations or located on naval vessels either homeported outside the United States or deployed to the overseas fleets.

Estimates of the civilian noninstitutional population, also available on request, differ from the civilian population in that they exclude persons residing in institutions, primarily nursing homes, prisons and jails, mental hospitals, and juvenile correctional facilities.⁷ While the civilian noninstitutional population has been adopted as the universe for many sample surveys, the current release is not consistent with results of current surveys conducted by the Census Bureau through the end of 1993, (including the Current Population Survey (CPS)) that were calibrated to 1980-census-based projections. Current estimates for dates from January 1, 1994, onward are not consistent with the results of those surveys, including the CPS that are calibrated to projections that have been adjusted for net underenumeration based on the 1990 Post Enumeration Survey.

⁶Reserve forces activated by Presidential order with Operations Desert Shield and Desert Storm were counted as active duty only if they were included in the military strength statistics of their respective services.

⁷For a complete definition of institutional population, see 1990 Census of Population and Housing, Publication 1990 CPH-R-1B, *Guide: Part B, Glossary*, pp. 24-26. Inmates of military stockades and jails are assumed to be in the active-duty Armed Forces and, therefore, would not be included in the civilian population; hence, they are not separately excluded as institutional residents.

Postcensal Estimation of the U.S. Resident Population by Sex, Race, and Hispanic Origin

Estimates of the U.S. population by 16 categories of sex, race, and Hispanic origin were derived quarterly by updating the resident population enumerated in the 1990 census through the components of population change. The following formula was applied to update each group:

1. 1990 enumeration of resident population,
2. plus births to U.S. resident women,
3. minus deaths to U.S. residents,
4. plus net international migration,
5. plus net movement of U.S. Armed Forces and civilian citizens to the United States.

Estimation of the components of population change.

A detailed description of the sources of data for the components of change and their method of estimation is available in *United States Population Estimates by Age, Sex, Race, and Hispanic Origin: 1980 to 1988*, Current Population Reports, series P-25, number 1045, pages 34 to 39. The following is a summary update of these data sources and procedures.

1. Registered births to U.S. resident women are estimated from data supplied by the National Center for Health Statistics (NCHS).⁸ Distributions of births by sex, by race of mother, and by Hispanic origin of mother were based on microdata files supplied through calendar year 1992 by NCHS from their registration system. For 1993 and the first half of 1994, we relied on preliminary estimates of total births from NCHS. To estimate the distribution of births by race and Hispanic origin of mother, we applied age-specific birth rates for 1992 for women in each racial group and for women of Hispanic origin to last year's estimates of the number of resident women.⁹ We adjusted the resulting births

⁸Sources include National Center for Health Statistics, *Advance Report of Final Natality Statistics, 1990, 1991, and 1992; Monthly Vital Statistics Reports*, vol. 41, no. 9, suppl., vol. 42, no. 3, suppl., and vol. 43, no. 5 suppl.; National Center for Health Statistics, *Annual Summary of Births, Marriages, Divorces, and Deaths: United States, 1991; Monthly Vital Statistics Reports*, vol. 42, no. 13; and unpublished data.

⁹For purposes of estimating the racial distribution of births and deaths, computation of age-specific birth rates is based on an alternative distribution of the population based on population estimates by the Method of Demographic Analysis. This method estimates population from a base distribution by age, sex, and race that is determined by historical administrative data, such as vital statistics and migration and medicare data, rather than the census enumeration. These estimates provide a population universe that is more consistent with current vital statistics, with respect to demographic characteristics, than the census universe. Hence, computing rates on Demographic-Analysis-consistent denominators, and later applying these rates to Demographic-Analysis-consistent population estimates, provides a more consistent basis for extending the vital statistics

- proportionately to sum to the preliminary estimates of total births from NCHS. To obtain cross-categories of race with Hispanic origin for all years, we distributed Hispanic origin births according to the distribution of Hispanic women 15 to 44 years of age by race in the 1990 census. Non-Hispanic births by race group were obtained by subtracting Hispanic births from all births. For each racial and Hispanic origin category, births by sex were estimated using sex ratios observed in 1991.
2. Registered deaths to U.S. residents by sex and race are also supplied by NCHS. Final data were available through 1992. Preliminary estimates of deaths, with distribution by sex and three race categories (White, Black, and all other) based on the 10 percent Current Mortality Sample, were available through 1993 and the first half of 1994.¹⁰ Deaths to the American Indian and Asian and Pacific Islander populations by sex were projected using life tables, with proportional adjustment to sum to the other-races total. Hispanic origin deaths by sex and race were also estimated using life tables, applied to a distribution of the Hispanic population by age, sex, and race.¹¹

3. The international net migration components are based on a variety of administrative sources and analytic estimates. The Immigration and Naturalization Service (INS) supplies data on legal immigrants. The Office of Refugee Resettlement (ORR) supplies data on persons admitted to the United States as refugees. Both of these sources supply data on country of birth.¹² We estimate the distribution by race and Hispanic origin from the country-of-birth tallies, with the racial and origin distribution

series than would an application to census-based estimates. Unfortunately, no Demographic Analysis estimates are available by Hispanic origin or for the decomposition of other races (non-White, non-Black) into American Indian and API, so the distribution to these categories had to be census-based.

¹⁰Final data are consistent with National Center for Health Statistics, *Advance Report of Final Mortality Statistics for 1990, 1991, and 1992*. These are published in NCHS, *Monthly Vital Statistics Report*, vol. 41, no. 7 suppl., vol. 42, no. 2 suppl., vol. 43, no. 6, suppl. Preliminary estimates and current mortality sample data are published in National Center for Health Statistics, *Annual Summary of Births, Marriages, Divorces, and Deaths: United States, 1993; Monthly Vital Statistics Report*, vol. 42, no. 13; National Center for Health Statistics, *Births, Marriages, Divorces, and Deaths for June, 1994; Monthly Vital Statistics Reports*, vol. 43, no. 6.

¹¹For time intervals through 1991, central death rates were interpolated between two life tables, the first for calendar year 1990 and the second for the year ending June 30, 1992. For intervals from calendar year 1992 onward, rates from the second of the two were assumed. Life tables for the Hispanic population by sex and the non-Hispanic populations by sex and race are unpublished and were prepared by Jennifer Cheeseman Day of the U.S. Bureau of the Census, Population Projections Branch.

¹²Immigrant data for fiscal years are obtained from the INS public use microdata file, from which data are summarized in the INS publication, *Statistical Yearbook of the Immigration and Naturalization Service*. Data on refugees are obtained from the ORR annual report to Congress: *Refugee Resettlement Program*, and the ORR *Monthly Data Report*. The count of legal immigrants included in population

of foreign-born migrants to the United States, from the census 20 percent sample. Data from the 1990 census on foreign-born migration from 1985 to 1990 were used for this purpose.

The Puerto Rico Planning Board supplied data on airline passenger traffic at the San Juan Airport through March 1994, which we used to estimate the balance of net migration between the United States and Puerto Rico. Migration from April through June 1994 was projected. The distribution of Puerto Rican migration by age, sex, race, and Hispanic origin is assumed constant and is based on the distribution of migrants from Puerto Rico to the United States, 1985 to 1990, from the 1990 census 20 percent sample, and the distribution of migrants from the United States to Puerto Rico, 1985 to 1990, from the 1990 census of Puerto Rico. The (presumably small) balance of migration between the United States and other outlying areas under U.S. jurisdiction is assumed to be zero.

Two numerically substantial types of international migration for which reliably accurate and current data are unavailable are undocumented immigration (both in and out of the U.S.) and the permanent emigration of legal residents. Undocumented immigration refers to the net increase of the national population due to change in residence across the national frontier by aliens, either by unauthorized entry or by overstaying a temporary (nonimmigrant) visa. For undocumented immigration, we make an allowance of 225,000 net migration per year, which is constant throughout the estimating period. For emigration of legal residents, we assume 222,000 a year, based on annual allowances of 195,000 foreign-born and 27,000 native-born emigrants.¹³

4. The temporary movement of Federally affiliated U.S. citizens consists mostly of movement of the active duty Armed Forces and Armed Forces' dependents between the United States and overseas.

estimates differs from INS publications, because it excludes immigrants who previously resided in the United States, were adjusting their legal residence status to that of immigrant, and who would be included in the estimates through another data series. These persons, excluded from the immigrant data, consist largely of refugees adjusting status (counted on arrival from the ORR data) and undocumented immigrants legalizing their status under provisions of the Immigration Reform and Control Act or earlier legislation (included in the current allowance for undocumented migration).

¹³These assumptions are projections, based on research from the 1990 census data on the foreign-born population by time of arrival, and data from INS on legal immigration. For a more detailed discussion of foreign-born emigration, see Bashir Ahmed and J. Gregory Robinson, *Estimates of Emigration of the Foreign-Born Population: 1980-1990*, U.S. Bureau of the Census, Population Division, Technical Working Paper no. 9. Discussion of the assumption on undocumented immigration can be found in J. Gregory Robinson, "Clarification and Documentation of Estimates of Emigration and Undocumented Immigration," unpublished U.S. Bureau of the Census memorandum.

Also included is the movement of civilian Federal employees and their dependents.

We estimate the migration of Federally affiliated citizens by observing trends in the number of personnel abroad from three sources:

- a. Armed Forces overseas strength statistics are supplied by the five branches of the Armed Forces in the Departments of Defense (Army, Navy, Marines, and Air Force) and Transportation (Coast Guard). Distributions by sex, race, and Hispanic origin are derived from separate tabulations provided by the Defense Manpower Data Center (Department of Defense), giving demographic detail by duty location and branch of service.
- b. The number of military dependents residing overseas is published by the Department of Defense for four branches of the Armed Forces (excluding Coast Guard). We assume the race distribution to be the same as the race distribution of the Armed Forces overseas.¹⁴ The distribution by sex is based on information on military dependents residing abroad from the 1970 census of the population of U.S. citizens residing overseas.
- c. The number of civilian Federal employees overseas is supplied by the Office of Personnel Management (OPM) and is inflated to include dependents.

The inference of net migration from this population to the United States follows a reverse component-of-change logic applied to the Federally affiliated overseas population. The net increase in the overseas Federal population, minus net recruits to this population from abroad (for example, residents of outlying areas joining the Armed Forces), minus births, plus deaths, provides an estimate of the net migration to the overseas Federal population from the United States. The negative of this estimate is the estimated migration of Federally affiliated citizens to the United States from overseas.

The net migration of U.S. citizens not affiliated with the Federal Government, as well as the temporary movement of foreign students, scholars, and embassy personnel, is tacitly assumed to be zero. Although these movements do, in fact, represent a change of residence in and out of the United States according to the residence definition used in the estimates.

Estimation of the U.S. Population by Age

The inflation-deflation method. Once the postcensal population estimates by sex, race, and Hispanic origin are computed, the age distribution of each sex-race-Hispanic category is estimated by the inflation-deflation

method. This method seeks to allow each age group in the census base population to advance 1 year of age for each year after the census, reflecting the effects of births, deaths, and migration, while preserving without aging, the age pattern of census undercoverage estimated for the base population. The method is described in detail in *U.S. Population Estimates by Age, Sex, Race, and Hispanic Origin: 1980 to 1991*, Current Population Reports, P25-1095, pp. xvii-xviii.

Components of change by age. Deaths to U.S. residents by age, sex, and race (White, Black, "other") under age 70, and the total for 70 and over, are based on official tabulations of deaths by single-years-of-age from the National Center for Health Statistics (NCHS). The age distribution of deaths to residents 70 years of age and over are based on rates computed from Health Care Finance Administration (HCFA) data on deaths to medicare recipients by age, sex, and race (White, Black, "other" races), and proportionally adjusted to be consistent with NCHS total deaths to persons 70 and over.¹⁵

For the American Indian, Eskimo, and Aleut and Asian and Pacific Islander populations, deaths by age are estimated from 1990 and 1992 life tables, proportionally adjusted to sum to NCHS totals by sex and race, and to deaths to other races (the two categories combined) by age and sex, also supplied by NCHS. For the Hispanic population by sex and race, the 1990 and 1992 Hispanic life tables are similarly applied to produce Hispanic deaths by age, sex, and race. Non-Hispanic deaths are then derived as total minus Hispanic, within categories of age, sex, and race.¹⁶

For legal alien immigrants admitted by the Immigration and Naturalization Service (INS), age and sex are available on the individual immigrant records. For refugee categories, the age distribution is based on distributions of refugees of the same country of birth, adjusting to permanent immigrant status through INS, and also from the individual immigrant records.

We estimated the age distribution of Federally affiliated U.S. citizens by the method of cohort survival, using age distributions of Armed Forces overseas supplied by the Department of Defense, Defense Manpower Data Center, as well as distributions of overseas Armed Forces' dependents from the 1970 census, and overseas civilian Federal employees from the Office of Personnel Management (OPM).

¹⁵The use of medicare data for deaths is described more fully in Frederick W. Hollmann, *U.S. Population Estimates by Age, Sex, Race, and Hispanic Origin: 1980 to 1991*, Current Population Reports, P25-1095.

¹⁶The 1990 and 1992 life tables for the Hispanic population by sex and the non-Hispanic population by sex and race are unpublished, and were prepared by Jennifer Cheeseman Day of the U.S. Bureau of the Census, Population Projections Branch.

¹⁴Department of Defense, Directorate for Information, Operations, and Reports, Worldwide Manpower Distribution by Geographic Area.

Estimation of the U.S. Population by Quarter and Month

All the population detail shown in this report was also produced for monthly reference dates, although the calendar quarter was the basic time interval for estimating distributions of components of change by age, sex, race, and Hispanic origin.

Usually, the data sources for components of change provide quarterly data. Data on registered births and deaths from NCHS were also available by month, as were data from the INS and ORR on legal alien immigration and refugees, and passenger traffic data used to infer Puerto Rican migration. Most Armed Forces strength data by branch of service, used to infer movement of Armed Forces from overseas, were available by month, whereas data on Armed Forces' dependents, and all Armed Forces demographic detail before 1993, were available by quarter.¹⁷ No seasonal information was available for undocumented immigration and emigration of legal residents, so no seasonality was assumed. For births, deaths, and legal alien immigrants, quarterly distributions by age, sex, race, and Hispanic origin were independently derived. For other components, sex, race, and Hispanic origin distributions were imputed to quarterly data; either from the current calendar year or fiscal year or on the basis of a projection from a past year.

The procedure for estimating the population by quarter, once the quarterly components of change were estimated, followed the procedure described above. The single-year age distribution of the base population was further distributed to quarter-year of age in proportion to registered births in the birth year of each cohort.¹⁸ The inflation-deflation method was employed to the quarter-year-of-age population, as updated through components of change by age, sex, race, and Hispanic origin.

To complete the population detail for the remaining months that do not begin a calendar quarter, we estimated monthly series of births, deaths, and all of the subcomponents of immigration by sex, race, and Hispanic origin. Aggregate monthly components (births, deaths, international migration, and Federal U.S. citizen migration) were expanded to month-of-birth cohort by imputation from quarterly data. The resulting monthly

¹⁷Estimates of naval personnel residing overseas is partially dependent on the number of persons located on naval vessels by homeport and overseas deployment status. These data were supplied only once a year, as of June 30, so the consequent migration flow had to be assumed uniform during each year.

¹⁸Because of the limitations of the historical birth series, no distributions of births by month (or quarter) were employed for cohorts born before 1920. The procedure was not differentiated by race prior to 1942. For cohorts born from 1942 forward, it was carried out separately for the White and Black populations only. For cohorts born before 1920 and all cohorts of the American Indian, API, and Hispanic population (by race), quarter-year of age was determined by full year of age by osculatory interpolation.

series of month-of-birth cohort components were applied to population estimates for quarterly dates to produce the monthly population detail.

Current and Future Revisions to National Population Estimates Methodology

All the national data in this report are preliminary and are subject to future revision. A number of technical changes are introduced with this series of estimates.

For the first time, data from the 1990 census on migration of the foreign-born population, coupled with data from the Immigration and Naturalization Service on legal immigration, were used to estimate undocumented migration and the emigration of legal residents. Estimates through last year reflected analyses of international migration based on the 1980 census.¹⁹

A further technical development that is new with this series of estimates is the inclusion of data from an annual group-quarters survey to estimate the population living in institutions that is subtracted for purposes of estimating civilian noninstitutional population for July 1 dates through 1993. Earlier practice was to estimate the institutional population by assuming that institutional proportions by age, sex, race, and Hispanic origin remain unchanged from the last census. In the 1980's, this assumption resulted in a considerable bias for some demographic categories, because of a substantial increase in rates of incarceration during the decade. Inclusion of group-quarters survey data should serve to prevent this type of bias.

Current research at the Bureau of the Census is in progress to expand migration accounting to include estimates of "nonimmigrants"; persons (mostly foreign students and scholars) who enter and leave the country legally and are subject to enumeration in a census, but are not permanent immigrants, as defined by INS.²⁰ While the net gain or loss to the total population from this source is small, the accounting of nonimmigrants should improve estimates of age distribution; because the migration is temporary, migrants do not remain in the population to grow older with passing years, as is assumed for the balance of the population. An improved accounting of nonimmigrant migration also should serve to improve estimates of the more elusive migration components: emigration of legal residents, and net undocumented immigration.

¹⁹Bashir Ahmed and J. Gregory Robinson, op. cit.; J. Gregory Robinson, op. cit.

²⁰"Nonimmigrant" as used in INS publications, embraces a much larger category of persons. It includes refugees, as well as nonresident visitors, such as tourists. As previously discussed, refugees are already included in population estimates through the ORR data series. Nonresident visitors should not be included, as they would not be eligible for enumeration in a census.

STATE ESTIMATES METHODOLOGY

State All-Ages Totals

In the production of State population totals, States are treated as a tabulation geography rather than an estimates geography. This means the State estimates methodology is actually the methodology for counties, and the State population estimates are derived by summing the county estimates to the State level. The population of the District of Columbia is estimated as if the District of Columbia were a county.

Methodology Used for County Population Estimates

The Census Bureau develops county estimates with a demographic procedure called a “component change” method. A major assumption underlying this approach is that the components that constitute population change can be represented by administrative-data series in a statistical model. In order to build the model, Census Bureau demographers estimated each component of population change separately. For the population residing in households, the components of change are births, deaths, and net migration, including net immigration from abroad. For the nonhousehold population, change is represented by net change in the population in group quarters. We have listed each of these components in appendix tables 1 through 3 and covered them item by item in the following text. Appendix tables 1 through 3 show the derivation of a July 1 population estimate for a typical county in a typical estimate year. Note that this description of the population estimates process is generic for a typical estimates year. The process may not be applied exactly as described to an individual county in a specific estimate year.

To develop county population estimates, we use a component change procedure called the Tax Return method (formerly called the Administrative Records method). Each component in our model is represented with data that are symptomatic of some aspect of population change. For example, birth certificates are symptomatic of additions to the population resulting from births, so we use these data to estimate the birth component for a county.

Except for the net migration component, we calculate the change components for a July 1 county estimate from data items that are extrapolated. We extrapolate because data needed for the estimate year, covering the period from July 1 of the previous year to June 30 of the current estimate year, are not always available for counties at the time we develop the estimate. For example, we could not obtain 1993 births for January through June for most counties because the data for 1993 were not available at the time we prepared the estimate.

When we do not have data for all counties for the current estimate year, we develop an estimate of the data component through one or more simplifying assumptions. In the simplest case, we assume there is no change in the data between the current estimate year and the prior estimate year. In other cases, we may have data at the State level but not at the county level. We assume that the distribution of data by county did not change from the prior year. The county distribution is then applied to the current State total data to estimate current year data for counties. For example, we have total births for States for 1993, but have total births for counties only for 1992. We apply the 1992 county distribution of births within States to the 1993 State totals to estimate county totals for 1992. We always carefully examine the birth data for last year to ensure that the current-year estimate is reasonable. When we prepare our initial population estimates, we use the same variant of the component model for all States. A year later, we replace these initial estimates with “revised” estimates based on the actual data for all components of population change.

In the discussions below, line numbers refer to a hypothetical county population estimate in a typical estimate year, shown in appendix tables 1 through 3.

Explanation of Appendix Table 1. Estimate of the Population Under Age 65

Base Populations

Line 1, Base total population. The base population for the estimate of the population under age 65 is the revised county estimate for the prior estimate year. Each year, the population estimate represents population change from the prior year. The only year in which this is not true is in the year of the decennial census. In the decennial year, an estimate is prepared that represents population change between the census date and July 1 of that year. For example, the last decennial census was collected as of April 1, 1990. A population estimate was prepared that represented population change between April 1, 1990, and July 1, 1990. For official population estimates, the April 1, 1990, population is not adjusted for census undercount.

- a. *Census errata.* Geographic and enumeration errors in the 1990 census for some areas have been identified and subsequent corrections made. These errors may have an impact on population estimates in some counties. Corrections to the 1990 census were first incorporated into the estimates series with the release of estimates for July 1, 1994.
- b. *Census modifications.* The 1990 census population counts were modified to handle two areas problematic for estimates development: (1) We modified the census results so that persons responding “other”

to the 1990 census race question were reclassified into one of the four major race classifications: White, Black, Asian/Pacific Islander (API), or American Indian/Alaska Native (AIAN); (2) The population age distribution was also modified, owing to a misreporting problem. For more information about these modifications, call the Census Bureau on 301-457-2422 and ask for a copy of the technical documentation developed for the modified age/race/sex file (MARS).

- c. *Boundary changes.* Boundary changes include new incorporations, disincorporations, annexations, deannexations, mergers, and consolidations. In general, county population estimates are consistent with boundaries current as of the estimate date. Boundary changes occurring after January 1, 1990, were incorporated into the population estimates base beginning with estimates for July 1, 1994.

Line 2, Base group quarters population under age 65. This component is primarily a combination of military personnel living in barracks, college students living in dormitories, and persons residing in institutions. Inmates of correctional facilities, persons in health care facilities and persons in Job Corps Centers are also included in this category. We have excluded persons aged 65 and over residing in nursing homes and other facilities from this category since they are implicitly included in the estimate of the 65 and over population. The base group quarters population for the current estimate year is the revised group quarters population from the prior estimate year. In the first estimate year following the decennial census, the base group quarters population is the group quarters population as enumerated in the decennial census.

Line 3, Base total population aged 65 years and over. This component is the revised estimate of the population aged 65 years and older from the prior estimate year.

Line 4, Household base population under age 65. After we subtract the group quarters populations (line 2) and the population aged 65 and over (line 3) from the base population (line 1), the remainder is what we call the under 65 household population. The household population under age 65 is also decremented by those persons aged 64 and over who will turn 65 (expressed as a factor) during the estimates cycle. This process of estimating the population aged 64 years old for counties is achieved through the following steps:

1. Develop a county-level ratio of the population aged 64 to the population 65 and older in the last census.
2. Develop a national-level ratio of the population aged 64 to the population 65 and older in the last census.

3. Develop a national-level ratio of the population aged 64 to the population 65 and older for each estimate year.
4. Update the county-specific ratios with the change in the national level ratios (estimate year/census base).
5. Apply the county-specific ratios to the household population under 65 in the estimates base.

Components of Change for the Household Population Under Age 65

Line 5, Estimated resident births, 7/1 (prior year) to 6/30 (estimate year). Resident births are recorded by residence of mother, regardless of where the birth occurred; hence, a county need not have a hospital to have resident births. If birth data are not available by county for all States for the estimate year when the county estimates are produced, we assume that prior-year county birth data approximate estimate year births.

Line 6, Estimated resident deaths to the household population under 65, 7/1 (prior year) to 6/30 (estimate year). We use death data tabulated by the most recent residence of the decedent, not by the place where death occurred. We tabulate NCHS (National Center for Health Statistics) deaths to the population under 65 years by race and control these to State specific tabulations provided by the FSCPE (Federal State Cooperative Program for Population Estimates) agencies. We then rake the estimated deaths so they sum to national death totals by race. If estimate year death data are not available by county for all States when the county estimates are produced, we assume that prior-year county death data approximate estimate year deaths. Our estimate of deaths for the under 65 years of age population is shown on line 6.

Line 7, Estimated net movement from abroad (Immigration), 7/1 (prior year) to 6/30 (estimate year). We estimate the number of foreign immigrants who move into the county during the estimate interval. The estimate is based on the national estimate of foreign migration developed by the Census Bureau. Our estimate includes emigration from the United States and the immigration of refugees, legal immigrants, undocumented immigrants, net movement from Puerto Rico, and Federal and civilian citizen movement from abroad. We allocate the national estimate of the number of undocumented immigrants to States and counties by using the distribution of the foreign-born population who arrived between 1975 and 1980 and were enumerated as residents in the 1980 census. Legal immigrants and refugees are distributed to counties on the basis of county of intended residence as reported to the Immigration and Naturalization Service.

Line 8, Estimated migration base. We develop the migration base by adding one-half of the following to the household base population under 65 years (line 4): estimated resident births (line 5), minus estimated resident deaths under 65 years (line 6), plus estimated net immigration (line 7). Only half of the additions/deletions to the population would have taken place by the midpoint of the 12 months. A factor of one-half, or an “exposure factor” must be entered into the equation. The population base at risk of migrating is usually considered the base at the midpoint of the period since the population at the beginning of the estimate period has not yet experienced the births and deaths that are reflected in the population at the end of the period. The population at the end of the period includes immigrants and excludes outmigrants. The best compromise is to take the population at the midpoint of the period. Estimated resident births, estimated deaths to people under age 65, and net immigration from abroad are assumed to have been evenly distributed throughout the estimate interval and, therefore, exposed to the potential for migration, on average, for one-half of the period.

Line 9, Estimated migration rate. We use individual Federal income tax returns to measure the internal, or domestic, migration of the population under 65 years of age by matching the returns for successive years for that age group. We determine the status of the filer by noting the address, used as a proxy for place of residence, on tax returns filed in the prior year and in the estimate year. We categorize the filers in each county into: (1) immigrants (INS), (2) outmigrants (OUTS), and (3) nonmigrants (NONMOVERS). We derive a net migration rate for each county based on the difference between the inmigration and outmigration of tax filers and his or her dependents.

Line 10, Estimated net domestic migration. Net migration is the product of the migration base (line 8) and the net migration rate (line 9). If this figure is preceded by a minus sign (-), then the figure indicates net outmigration; otherwise, the figure represents net immigration.

Estimated Populations

Line 11, Estimated household population under age 65. The household base population under age 65 (line 4) is combined with the estimated components of change for the household population under age 65 to arrive at the estimated household population under age 65 in the estimate year.

Line 12, Estimated group quarters population under age 65. We assume that military personnel living off base and those living on base in family quarters are captured in the components of change of the household

population described above. Military barracks population figures and crews of naval vessels are obtained from an annual survey of on-base housing facilities for unaccompanied personnel. The survey is conducted by the Department of Defense (DOD) in September each year. Certain States also collect military barracks population for their States, and those data are used where appropriate. If Department of Defense survey results are not available in the estimate year, the prior year results are used as estimates for the current estimate year. College students living in dormitories; inmates of correctional and juvenile facilities; and persons in health care facilities, nursing homes, and Job Corps Centers are also included in this estimate. We exclude persons aged 65 and over residing in nursing homes and persons in homes for the aged from this estimate since they are implicitly included in the separate estimate of the 65 and over population. Data on college dormitory populations relate generally to the fall of the preceding year. Data on institutional populations relate to July 1 of the estimate year or represent some type of average for the estimate year. Data on the nonmilitary components of the group quarters population are collected primarily through an annual group quarters report submitted by State members of the Federal-State Cooperative Program for Population Estimates. The group quarters report is used to estimate the change in the group quarters population between the prior year and the estimate year. If no data are available for any component of the group quarters population, we assume that no change has occurred. In the first estimate year following a decennial census, the group quarters report is used to estimate the change in group quarters population between the census and the estimate year.

Line 13, Estimated total population under age 65. The estimated total population under age 65 is the estimated household population under age 65 (line 11) and the estimated group quarters population under 65 (line 12).

Explanation of Appendix Table 2. Estimate of the Population Aged 65 and Over

Base Populations

Line 1, Base total population aged 65 and over. The base population for the estimate of the population age 65 and over is the revised household population estimate of the 65 and over population for the prior estimate year. We use the county-level tabulations of the number of medicare enrollees obtained from the Health Care Financing Administration to assist us in developing the estimate. The availability of this data allows us to develop a separate estimate of change in the population over age 64. If the medicare enrollment data are not available at the time we prepare the estimates, we use the change from the prior estimate year as an estimate of change in the current estimate.

Line 2, Base group quarters population aged 65 and over. This component is an estimate of the population aged 65 and over residing in nursing homes, prisons, and other group quarters facilities.

Line 3, Estimated population turning 65 in current year. This component is an estimate of the population who reached their 65th birthday during the estimate year. They are, in a sense, the number of people "born" into the 65 and older age group.

Line 4, Household base population aged 65 and over. This component is calculated by subtracting the group quarters population (line 2) and adding the population turning age 65 in the current year (line 3).

Components of Change for the Household Population Aged 65 and Over

Line 5, Estimated resident deaths to the household population aged 65 and over, 7/1 (prior year) to 6/30 (estimate year). Our estimate of deaths for the population aged 65 and older is shown on line 5. See the explanation of under 65 deaths for more detail.

Line 6, Estimated foreign migration 65 and over, 7/1 (prior year) to 6/30 (estimate year). Same type of calculation as under 65 foreign immigration (appendix table 1, line 7).

Line 7, Estimated migration base 65 and over. Same type of calculation as under 65 migration base (appendix table 1, line 8).

Line 8, Estimated migration rate 65 and over. The migration rate for the population aged 65 and older is obtained by

MIGRO=

$$\{MED_t - [MED_{t-1} + ((AGE_t - DEAO_t) * MCOV)]\} / MED_{t-1}$$

where MED is medicare enrollees, Age is the population turning 65 in the current year, DEAO is the period deaths to the population 65 and over, and MCOV is the medicare coverage (medicare coverage is defined as medicare enrollees aged 65 and over in 1990 divided by the census population aged 65 and over).

Line 9, Estimated net migration 65 and over. Same type of calculation as under 65 net migration (appendix table 1, line 10).

Line 10, Estimated household population aged 65 and over. The household base population aged 65 and over (line 4) is combined with the estimated components of change for the household population aged 65 and over to arrive at the estimated household population aged 65 and over in the estimate year.

Line 11, Estimated group quarters population aged 65 and over. Persons aged 65 and over residing in nursing homes, correctional facilities, and other group quarters. See under 65 calculation.

Line 12, Estimated total population aged 65 and over. The estimated total population aged 65 and over is the sum of the estimated household population aged 65 and over (line 10) and the estimated group quarters population 65 and over (line 11).

Explanation of Appendix Table 3. Final Total Population Estimate

Line 1, Estimated total population under 65. Copied from appendix table 1, line 13.

Line 2, Rake factor for the population under age 65 (line 2). The rake factor is used to ensure consistency between county estimates and independent estimates for the entire population of the United States. The factor is the national estimate of the total population under age 65 divided by the sum of the estimated total population under age 65 for all counties in the Nation.

Line 3, Final under age 65 estimate. The final under age 65 population is the estimated total population multiplied by the rake factor.

Line 4, Estimated total population aged 65 and over. Copied from appendix table 2, line 12.

Line 5, Rake factor for the population aged 65 and over. The rake factor is used to ensure consistency between county estimates and independent estimates for the entire population of the United States. The factor is the national estimate of the total population aged 65 and over divided by the sum of the estimated total population aged 65 and over for all counties in the Nation.

Line 6, Final estimate for the population aged 65 and over. The final 65 and older population is the estimated total population multiplied by the rake factor.

Line 7, Final total estimate. The final estimate is the sum of the under 65 estimate and the 65 and over estimate.

Final State Components of Change

The components of change shown in table 2 result from summing the under and over 65 age segments of each (except births) county/State component.

The net domestic migration shown also includes changes in group quarters for both the under and over 65 population. The residual shown is from the effect of the national proration procedure. It is the difference between the implementation of the national estimates model and the subnational model.

State Age-Sex Estimates

The State age-sex estimates are produced with a State estimates model that is a version of Component Method II. Estimates are produced for each single year of age by sex up to age 65. In this method each age follows the standard demographic formula of:

$$P_1 = P_0 + B - D + M$$

where P_1 is the population on the estimate date; P_0 is the population on the census date; B and D are the births and deaths occurring during the estimate period, and M is the net migration (including international net migration) occurring during the estimate period. This is a cumulative method, where the estimate period is from the date of the last census to the estimate date. The steps used in estimating single years of age (0 to 64) for the civilian population are summarized below:

1. The resident cohort population by single year of age is developed by carrying forward the April 1, 1990, census count (for each age) to the July 1 estimate date.
2. Births entering each cohort for the period between April 1, 1990, and the July estimate date are added where appropriate.
3. An estimate of the Armed Forces cohort population for each age 17 through 64 on the estimate date, is subtracted from the resident cohort population to create the civilian cohort population.
4. An estimate of the net civilian migration for 1990 to the estimate date is added.
5. An estimate of the net change in civilian population entering the Armed Forces' population during the estimate period is added.

The result of these five steps is unadjusted civilian age estimates, but without sex detail. Sex detail originates from the following steps:

1. The 1990 census proportion of male civilian population is calculated for each year of age by State.
2. National sex ratios by single year of age are calculated for both the 1990 census civilian population and for each estimate year.

3. The change in the national sex ratios between the estimate year and the census base year are used to update the 1990 State ratios.

4. These are applied to the State single-year civilian population estimates for both sexes to obtain civilian sex detail by age.

Final steps in the component method for age are to:

1. Adjust each age-sex cell (0 to 64) to an independent national civilian population estimate.
2. Further adjust each age-sex cell within a State to the civilian State population total.
3. Add estimates of Armed Forces by age and sex to the civilian population to produce resident population.

The vital statistics used in the age estimates are from the same sources used in the Federal Tax Returns Method. The net migration component revolves around elementary school enrollment and school-age migration. It is developed in two age segments: (1) State school-age net migration for the estimate period is used to formulate an amount of net migration for each age under age 17; and (2) Each State's school-age migration rate is converted to net migration rates for single years 17 through 64, then applied to a base (cohort for that age minus one-half the deaths to the cohort) in order to derive net migration amounts.²¹

The Armed Forces data used in this method are obtained from the Departments of Defense and Transportation. All military persons are assumed to be between the ages of 17 and 64. State Armed Forces data are not provided by age or sex. National level data are used to assign age-sex detail to the States. The group quarters data are updated on an annual basis.

ACCURACY OF THE ESTIMATES

As part of our population estimates evaluation program, we prepared April 1, 1990, national and State population estimates by age to compare with 1990 decennial census results. A summary of these comparisons is included as appendix tables B and C in report P25-1106. The full results of the April 1990 evaluation are in Bureau of the Census Technical Working Paper number 5.

²¹The methodology for developing the migration component by age is described in more detail in Current Population Reports, Series P25-1010. The 1990-94 estimates now use the 1985-90 migration pattern reported in the 1990 census.

— Represents zero or a number that rounds to zero.

¹Persons of Hispanic origin may be of any race. Information on the total and Hispanic population shown in this report was collected in the 50 States and the District of Columbia, and therefore, does not include residents of Puerto Rico.

Note: These estimates are consistent with the population as enumerated in the 1990 census and have not been adjusted for census coverage errors.

Table 11. Estimates of the Population by Type for the United States: April 1, 1990, to December 1, 1994

[In thousands. Estimates for each month from January 1, 1950, to March 1, 1980, are given in Current Population Reports, P25-1045. Estimates for months from April 1, 1980, to March 1, 1990, are available on request]

April 1 -----	248 718	249 233	247 078	243 749

Note: Census count April 1, 1990—248,718,291. The April 1, 1990, census count includes count resolution corrections processed through March 1994 and does not include adjustments for census coverage errors.

Appendix

Derivation of 1994 Estimates for a Hypothetical County

Table 1. Estimate of the Population Under Age 65

	Value	Derivation or source
BASE POPULATIONS		
1. Base population	93,401	Revised estimate from prior year
2. Base group quarters population under age 65	5,660	See text for detailed source
3. Base population age 65 years and over	4,021	See text for detailed source
4. Household base population under age 65 years	83,705	(4)=(1)-(2)-(3)-[(.00362)*(3)]
COMPONENTS OF CHANGE FOR THE HOUSEHOLD POPULATION UNDER AGE 65		
5. Estimated resident births: 7/1 (prior year) to 6/30 (estimate year)	1,924	See text for detailed source
6. Estimated resident deaths to the household population under age 65 years	157	See text for detailed source
7. Estimated immigration: 7/1 (prior year) to 6/30 (estimate year)	164	See text for detailed source
8. Estimated migration base	84,671	(8)=(4)+0.5 * [(5) -(6) + (7)]
9. Estimated migration rate	-0.00943	See text for detailed source
10. Estimated net migration	-798	(10)=(8) * (9)
11. Estimated household population under age 65	84,838	(11)=(4)+(5)-(6)+(7)+(10)
12. Estimated group quarters population under age 65	5,660	See text for detailed source
13. Estimated total population under age 65	90,498	(13)=(11)+(12)

Table 2. Estimate of the Population Aged 65 and Over

	Value	Derivation or source
BASE POPULATIONS		
1. Base total population aged 65 and over	4,021	7/93 population estimate
2. Base group quarters population aged 65 and over	642	See text for detailed source
3. Estimated population turning 65 in current year	225	See text for detailed source
4. Household base population aged 65 and over	3,604	(4)=(1)-(2)+(3)
COMPONENTS OF CHANGE FOR THE HOUSEHOLD POPULATION AGED 65 AND OVER		
5. Estimated resident deaths to the household population aged 65 and over	168	See text for detailed source
6. Estimated foreign immigration: 7/1/93 to 6/30/94	21	See text for detailed source
7. Estimated migration base	3,531	(7)=(4)+0.5 x [(6)-(5)]
8. Estimated migration rate	0.0317236	See text for detailed source
9. Estimated net migration	112	(9)=(7) x (8)
10. Estimated household population aged 65 and over	3,569	(10)=(4)-(5)+(6)+(9)
11. Estimated 1994 group quarters population	586	See text for detailed source
12. Estimated total population aged 65 and over	4,155	(12)=(11)+(10)

Table 3. Final Total Population Estimate

	Value	Derivation or source
1. Estimated total population under 65	90,498	Line 13 from table 1
2. Rake factor for the population under 65	1.000435	See text for explanation
3. Final estimate for the population under 65	90,537	(3)=(2) x (1)
4. Estimated total population aged 65 and over	4,155	Line 12 from table 2
5. Rake factor for the population aged 65 and over	1.001034	See text for explanation
6. Final estimate for the population aged 65 and over	4,159	(6)=(4) x (5)
7. Final total estimate	94,696	(7)=(3)+(6)
