Optimum Nonresponse Subsampling Rate for the American Community Survey ${ }^{1}$<br>Anthony Tersine and Michael Starsinic, U.S. Census Bureau<br>Anthony Tersine, U.S. Census Bureau, Demographic Statistical Methods Division, Washington, D.C. 20233

### 1.0 Introduction

The American Community Survey (ACS) is designed as a monthly mail-out survey with followup by Computer Assisted Telephone Interviewing (CATI) and Computer Assisted Personal Interviewing (CAPI) operations during a three month interview cycle. The ACS is an annual survey of three million addresses with approximately one-twelfth of the sample mailed out each month. All households with a mailable address are sent a mail questionnaire during the first month of the interviewing cycle. The mailable cases are sent an initial letter and reminder card to return the survey. Also a second questionnaire is delivered if the housing unit does not return the first questionnaire within a few weeks time. If a mail form is incomplete or has more household members than allowed on the form then a telephone failed edit follow-up (TFEFU) operation is conducted to obtain the missing information. During the second month, all households which did not return a mail form and for which we can obtain a telephone number are sent to CATI. During the third month, all households which did not return a mail form or for which we did not obtain a CATI interview are sent to CAPI. Those eligible for CAPI are subsampled at two different rates: 2 -in-3 for units without a mailable address and 1-in-3 for all other units.
Is the current assumption of CAPI subsampling at 1 -in-3, the correct rate? This paper will look at the assumptions behind that rate and see if they are still valid at the current time. The 1 -in- 3 rate was calculated in Alexander (1993) as 0.38 and changed to $1-\mathrm{in}-3$ for operational simplicity.

### 2.0 Costs and Definitions

We will first define variables for each mode and the values for each.

### 2.1 Mail Costs

| n | $3,000,000$ | total annual sample |
| :--- | :--- | :--- |
| $\mathrm{P}_{\mathrm{d}}$ | 0.96 | proportion of sample mailable |
| $\mathrm{P}_{\mathrm{o}}$ | 0.90 | proportion of sample in occupied housing units |
| $\mathrm{C}_{\mathrm{m} 0}$ | 3.92 | cost for each mailout case |
| $\mathrm{C}_{\mathrm{mr}}$ | 14.85 | additional cost for each mail return case |
| $\mathrm{C}_{\mathrm{mb}}$ | 8.88 | cost for mailback and processing returns |
| $\mathrm{C}_{\mathrm{m} 2}$ | 2.33 | cost for each second mailing |
| $\mathrm{C}_{\mathrm{mf}}$ | 15.10 | cost for each TFEFU |
| $\mathrm{R}_{\mathrm{mf}}$ | $1 / 3$ | proportion of mail returns needing TFEFU |

[^0]$\mathrm{R}_{\mathrm{m}} \quad 0.50 \quad$ proportion of deliverables returned
$\mathrm{R}_{\mathrm{m} 2} \quad 0.40 \quad$ proportion of mail returns needing second mailing
$R_{m o} 0.555556$ proportion of occupied deliverables returned $\left(R_{m} / P_{o}\right)$
The value of $\mathrm{C}_{\mathrm{mr}}$ is calculated as follows:
$$
\mathrm{C}_{\mathrm{mr}}=\mathrm{C}_{\mathrm{mb}}+\mathrm{R}_{\mathrm{mf}} \mathrm{C}_{\mathrm{mf}}+\mathrm{R}_{\mathrm{m} 2} \mathrm{C}_{\mathrm{m} 2}=8.88+(1 / 3) * 15.10+0.4 * 2.33=14.85
$$

### 2.2 Telephone Costs

$\mathrm{C}_{\mathrm{ti}} \quad 50.94 \quad$ cost for each telephone interview
$\mathrm{C}_{\mathrm{tni}} \quad 12.73 \quad$ cost for each telephone noninterview
$e_{t} \quad 0.32$ proportion of non-mail returns eligible for CATI (good phone numbers)
$\mathrm{f}_{\mathrm{t}} \quad 1.00 \quad$ proportion of non-mail returns selected for CATI (current value)
$\mathrm{R}_{\mathrm{t}} \quad 0.60 \quad$ proportion of CATI eligible cases interviewed
$\mathrm{R}_{\mathrm{to}} \quad 0.75 \quad$ proportion of occupied CATI eligible cases interviewed
$\left[\left(1-R_{m}\right) R_{t}\right] /\left[\mathrm{P}_{\mathrm{o}} /\left(1-\mathrm{R}_{\mathrm{mo}}\right)\right]$

### 2.3 Personal Visit Costs

| $\mathrm{C}_{\mathrm{pi}}$ | 145.58 | cost for each personal visit interview |
| :--- | :--- | :--- |
| $\mathrm{C}_{\mathrm{pni}}$ | 72.79 | cost for each personal visit noninterview |
| $\mathrm{f}_{\mathrm{pd}}$ | $1 / 3$ | fraction of mailable noninterviews selected for CAPI (current value) |
| $\mathrm{f}_{\mathrm{pu}}$ | $2 / 3$ | fraction of non-mailables selected for CAPI (current value) |
| $\mathrm{R}_{\mathrm{p}}$ | 0.86 | proportion of CAPI cases interviewed |
| $\mathrm{R}_{\mathrm{po}}$ | 0.81998 | proportion of occupied CAPI cases interviewed (assume all vacants <br> interviewed) $\mathrm{N}_{\mathrm{pio}} / \mathrm{n}_{\mathrm{p}}$ |

The variable, $\mathrm{N}_{\mathrm{pi}}$, is defined as the number of occupied interviews in CAPI and is equal to the total number of CAPI interviews minus the number of vacant CAPI interviews. The total number of CAPI interviews is:

$$
\text { CAPI Int }=\left[n P_{d}\left(1-R_{m}\right) f_{t}\left(1-e_{t} R_{t}\right) f_{p d}+n\left(1-P_{d}\right) f_{p u}\right] R_{p}=402,342
$$

The number of vacant CAPI interviews is (We assume all vacants are interviewed.):
CAPI Vacant Int $=n P_{d}\left(1-P_{o}\right) f_{t} f_{p d}+n\left(1-P_{d}\right)\left(1-P_{o}\right) f_{p u}=104,000$
So $\mathrm{N}_{\text {pio }}=$ CAPI Int - CAPI Vacant $\operatorname{Int}=402,342-104,000=298,342$
The variable, $\mathrm{n}_{\mathrm{p}}$, is defined as the number of occupied housing units that were selected in the CAPI subsample:

$$
n_{p}=n P_{d} P_{o}\left(1-R_{m o}\right)\left(1-e_{t} R_{t o}\right) f_{t} f_{p d}+n\left(1-P_{d}\right) P_{o} f_{p u}=363,840
$$

### 3.0 Sample Sizes and Proportions by Mode

Let $\mathrm{s}_{\mathrm{m}}, \mathrm{s}_{\mathrm{v}}$, and $\mathrm{s}_{\mathrm{p}}$, be the proportions of the occupied housing units represented by the mail, CATI, and CAPI components.

- $\mathrm{s}_{\mathrm{m}}$ : proportion of occupied units represented by mail respondents
$\mathrm{s}_{\mathrm{m}}=\left(\mathrm{n} \mathrm{P}_{\mathrm{o}} \mathrm{P}_{\mathrm{d}} \mathrm{R}_{\mathrm{mo}}\right) /\left(\mathrm{n} \mathrm{P}_{\mathrm{o}}\right)=\mathrm{P}_{\mathrm{d}} \mathrm{R}_{\mathrm{mo}}=0.533333$
- $\quad \mathrm{s}_{\mathrm{t}}$ : proportion of occupied units represented by CATI interviews
$s_{t}=\left(n P_{o} P_{d}\left(1-R_{m o}\right) e_{t} R_{t o}\right) /\left(n P_{o}\right)=P_{d}\left(1-R_{m o}\right) e_{t} R_{t o}=0.102400$
- $\mathrm{s}_{\mathrm{p}}$ : proportion of occupied units represented by CAPI universe
$\mathrm{s}_{\mathrm{p}}=1-\mathrm{s}_{\mathrm{m}}-\mathrm{s}_{\mathrm{t}}=1-\mathrm{P}_{\mathrm{d}} \mathrm{R}_{\mathrm{mo}}-\mathrm{P}_{\mathrm{d}}\left(1-\mathrm{R}_{\mathrm{mo}}\right) \mathrm{e}_{\mathrm{t}} \mathrm{R}_{\mathrm{to}}=0.364267$
$\mathrm{s}_{\mathrm{p}}$ can be split into two components representing mailable and unmailable address.
- $\mathrm{s}_{\mathrm{pu}}$ : proportion of occupied units represented by unmailable CAPI cases

$$
\mathrm{s}_{\mathrm{pu}}=1-\mathrm{P}_{\mathrm{d}}=0.040000
$$

- $\mathrm{s}_{\mathrm{pd}}$ : proportion of occupied units represented by mailable CAPI cases

$$
s_{p d}=s_{p}-\left(1-P_{d}\right)=P_{d}\left[\left(1-R_{m o}\right)\left(1-e_{t} R_{t o}\right)\right]=0.324267
$$

We now look at the sample sizes $\left(\mathrm{n}_{\mathrm{m}}, \mathrm{n}_{\mathrm{v}}\right.$, and $\left.\mathrm{n}_{\mathrm{p}}\right)$ for the occupied units in the mail, CATI, and CAPI components.

- $\quad \mathrm{n}_{\mathrm{m}}$ : number of sample cases representing occupied unit mail respondents
$\mathrm{n}_{\mathrm{m}}=\mathrm{n}_{\mathrm{o}} \mathrm{s}_{\mathrm{m}}=\mathrm{n} \mathrm{P}_{\mathrm{o}} \mathrm{P}_{\mathrm{d}} \mathrm{R}_{\mathrm{mo}}=1,440,000$
- $\quad n_{t}$ : number of sample cases representing occupied unit CATI interviews
$n_{t}=n P_{o} f_{t} s_{t}=n P_{o} f_{t} P_{d}\left(1-R_{m o}\right) e_{t} R_{t o}=276,840$
- $\quad n_{p}$ : number of sample cases representing occupied unit CAPI universe
$n_{p}=n_{p u}+n_{p d}=n P_{o}\left[s_{p} f_{t} f_{p d}+\left(1-P_{d}\right)\left(f_{p u}-f_{t} f_{p d}\right)\right]=363,840$
$\mathrm{n}_{\mathrm{p}}$ can be split into two components representing mailable and unmailable address.
- $\mathrm{n}_{\mathrm{pu}}$ : number of sample cases representing CAPI universe of unmailable occupied units $\mathrm{n}_{\mathrm{pu}}=\mathrm{n} \mathrm{P}_{\mathrm{o}}\left(1-\mathrm{P}_{\mathrm{d}}\right) \mathrm{f}_{\mathrm{pu}}=72,000$
- $\quad \mathrm{n}_{\mathrm{pd}}$ : number of sample cases representing CAPI universe of mailable occupied units

$$
\mathrm{n}_{\mathrm{pd}}=\mathrm{n} \mathrm{P}_{\mathrm{o}}\left[\mathrm{~s}_{\mathrm{p}}-\left(1-\mathrm{P}_{\mathrm{d}}\right)\right] \mathrm{f}_{\mathrm{t}} \mathrm{f}_{\mathrm{pd}}=291,840
$$

### 4.0 Cost per Case by Mode and Total Non-Fixed Cost

We determine the overall cost for each interview by mode. The costs of the noninterviews for each mode are apportioned to interview cases as in Alexander, 1993.

Mail: $\quad \mathrm{C}_{\mathrm{m}}=\mathrm{C}_{\mathrm{m} 0} / \mathrm{R}_{\mathrm{m}}+\mathrm{C}_{\mathrm{mr}}+\left[\left(1-\mathrm{R}_{\mathrm{m}}\right) / \mathrm{R}_{\mathrm{m}}\right] \mathrm{C}_{\mathrm{m} 2}=3.92 / 0.5+14.85+[(1-0.5) / 0.5] * 2.33$ $=25.02$

CATI: $\quad \mathrm{C}_{\mathrm{t}}=\mathrm{C}_{\mathrm{ti}}+\left[\left(1-\mathrm{R}_{\mathrm{t}}\right) / \mathrm{R}_{\mathrm{t}}\right] \mathrm{C}_{\mathrm{tni}}=50.94+[(1-0.6) / 0.6] * 12.73=59.43$
CAPI: $\quad \mathrm{C}_{\mathrm{p}}=\mathrm{C}_{\mathrm{pi}}+\left[\left(1-\mathrm{R}_{\mathrm{p}}\right) / \mathrm{R}_{\mathrm{p}}\right] \mathrm{C}_{\mathrm{pni}}=145.58+[(1-0.86) / 0.86] * 72.79=157.43$
Based on the costs above, we calculate the non-fixed cost to be:

$$
\begin{align*}
& n_{m} C_{m}+n_{t} C_{t}+\left[n_{p d} R_{p o}+n_{p u} R_{p o}+n P_{d}\left(1-P_{o}\right) f_{t} f_{p d}+n\left(1-P_{d}\right)\left(1-P_{o}\right) f_{p u}\right] C_{p} \\
& =n P_{o} s_{m} C_{m}+n P_{o} f_{t} s_{t} C_{t}+n\left\{P_{o} R_{p o}\left[\left(s_{p}-\left(1-P_{d}\right)\right) f_{t} f_{p d}+\left(1-P_{d}\right) f_{p u}\right]+\left(1-P_{o}\right)\left[P_{d} f_{t} f_{p d}+(1) f_{p u}\right\}\right\} C_{p} \\
& \left.-P_{p}+1\right) \tag{4.1}
\end{align*}
$$

### 5.0 Average Noninterview Adjustment Factor

First we look at the sum of the weights for occupied interviewed cases.
$(1 / \mathrm{f})\left[\mathrm{n}_{\mathrm{m}}+\mathrm{n}_{\mathrm{t}} / \mathrm{f}_{\mathrm{t}}+\left(\mathrm{n}_{\mathrm{pd}} \mathrm{R}_{\mathrm{po}}\right) /\left(\mathrm{f}_{\mathrm{t}} \mathrm{f}_{\mathrm{pd}}\right)+\left(\mathrm{n}_{\mathrm{pu}} \mathrm{R}_{\mathrm{po}}\right) / \mathrm{f}_{\mathrm{pu}}\right] \quad$ where f is the overall sampling rate
This can be simplified to: $\quad(1 / \mathrm{f}) \mathrm{n} \mathrm{P}_{\mathrm{o}}\left[1-\mathrm{s}_{\mathrm{p}}\left(1-\mathrm{R}_{\mathrm{po}}\right)\right]$
So the nonresponse adjustment factor that weights this back up to the population total of occupied housing units, ( $1 / \mathrm{f}) \mathrm{n} \mathrm{P}_{\mathrm{o}}$, is: $1 /\left[1-\mathrm{s}_{\mathrm{p}}\left(1-\mathrm{R}_{\mathrm{po}}\right)\right]$

### 6.0 Variation of an Estimated Proportion

Let the estimated proportions for the three data collection modes be $\hat{\mathrm{P}}_{\mathrm{m}}, \hat{\mathrm{P}}_{\mathrm{t}}$, and $\hat{\mathrm{P}}_{\mathrm{p}}$. Then the overall estimator of a weighted proportion is:

$$
\begin{equation*}
\hat{P}=\left\{(1 / f)\left[n_{m} \hat{P}_{m}+\left(n_{t} / f_{t}\right) \hat{P}_{t}+\left(n_{p d} R_{p o} \hat{P}_{p}\right) /\left(f_{t} f_{p d}\right)+\left(n_{p u} R_{p o} \hat{P}_{p}\right) / f_{p u}\right]\right\} /( \tag{5.1}
\end{equation*}
$$

Under the assumption that $\hat{\mathrm{P}}_{\mathrm{m}}=\hat{\mathrm{P}}_{\mathrm{t}}=\hat{\mathrm{P}}_{\mathrm{p}}=\mathrm{P}=1-\mathrm{Q}$, the variance of $\hat{\mathrm{P}}$ is:

$$
\begin{aligned}
\operatorname{Var}(\hat{\mathrm{P}})= & {\left[\mathrm{n}_{\mathrm{m}} \mathrm{PQ}+\left(\mathrm{n}_{\mathrm{t}} \mathrm{PQ}\right) / \mathrm{f}_{\mathrm{t}}^{2}+\left(\mathrm{n}_{\mathrm{pd}} \mathrm{R}_{\mathrm{po}} \mathrm{PQ}\right) /\left(\mathrm{f}_{\mathrm{t}} \mathrm{f}_{\mathrm{pd}}\right)^{2}+\left(\mathrm{n}_{\mathrm{pu}} \mathrm{R}_{\mathrm{po}} \mathrm{PQ}\right) / \mathrm{f}_{\mathrm{pu}}{ }^{2}\right] / } \\
& \left\{\mathrm{n} \mathrm{P}_{\mathrm{o}}\left[1-\mathrm{s}_{\mathrm{p}}\left(1-\mathrm{R}_{\mathrm{po}}\right)\right]\right\}^{2}
\end{aligned}
$$

Which can be written as:
$\left[(\mathrm{PQ}) /\left(\mathrm{n} \mathrm{P}_{\mathrm{o}}\right)\right]\left[1-\mathrm{s}_{\mathrm{p}}\left(1-\mathrm{R}_{\mathrm{po}}\right)\right]^{-2}\left[\mathrm{~s}_{\mathrm{m}}+\mathrm{s}_{\mathrm{t}} / \mathrm{f}_{\mathrm{t}}+\left\{\left(\mathrm{s}_{\mathrm{p}}-\left(1-\mathrm{P}_{\mathrm{d}}\right)\right) \mathrm{R}_{\mathrm{po}}\right\} /\left(\mathrm{f}_{\mathrm{t}} \mathrm{f}_{\mathrm{pd}}\right)+\left\{\left(1-\mathrm{P}_{\mathrm{d}}\right) \mathrm{R}_{\mathrm{po}}\right\} / \mathrm{f}_{\mathrm{pu}}\right]$

### 7.0 Optimization of Subsampling Rates

### 7.1 Variance Function

We want to optimize the subsampling rates $f_{t}, f_{p d}$, and $f_{p u}$. Using (4.1) for costs and (6.1) for the variance, we can calculate the optimal subsampling rates.

Choose a reliability, V , for a given P and set $\mathrm{V}=(6.1)$. We want to solve this as a function of $\mathrm{f}_{\mathrm{t}}$, $f_{p d}$, and $f_{p u} . V, P, Q, P_{o}$, and $\left[1-s_{p}\left(1-R_{p o}\right)\right]^{-2}$ are not functions of the sampling parameters, so we write

$$
\mathrm{K}^{*}=\left[\mathrm{s}_{\mathrm{m}}+\mathrm{s}_{\mathrm{t}} / \mathrm{f}_{\mathrm{t}}+\left\{\left(\mathrm{s}_{\mathrm{p}}-\left(1-\mathrm{P}_{\mathrm{d}}\right)\right) \mathrm{R}_{\mathrm{po}}\right\} /\left(\mathrm{f}_{\mathrm{t}} \mathrm{f}_{\mathrm{pd}}\right)+\left\{\left(1-\mathrm{P}_{\mathrm{d}}\right) \mathrm{R}_{\mathrm{po}}\right\} / \mathrm{f}_{\mathrm{pu}}\right] /[\mathrm{f} \mathrm{~N}]
$$

which does not depend on the sampling parameters.
Letting $\mathrm{n}=\mathrm{f} \mathrm{N}$ and $\mathrm{K}=1 / \mathrm{K}^{*}$, we calculate

$$
\begin{equation*}
\mathrm{n}=\mathrm{K}\left[\mathrm{~s}_{\mathrm{m}}+\mathrm{s}_{\mathrm{t}} / \mathrm{f}_{\mathrm{t}}+\left\{\left(\mathrm{s}_{\mathrm{p}}-\left(1-\mathrm{P}_{\mathrm{d}}\right)\right) \mathrm{R}_{\mathrm{po}}\right\} /\left(\mathrm{f}_{\mathrm{t}} \mathrm{f}_{\mathrm{pd}}\right)+\left\{\left(1-\mathrm{P}_{\mathrm{d}}\right) \mathrm{R}_{\mathrm{po}}\right\} / \mathrm{f}_{\mathrm{pu}}\right] \tag{7.1}
\end{equation*}
$$

### 7.2 Cost Function

Substituting (7.1) into (4.1) gives us the objective function to be minimized

$$
\begin{aligned}
& \left\{\mathrm{K}\left[\mathrm{~s}_{\mathrm{m}}+\mathrm{s}_{\mathrm{t}} / \mathrm{f}_{\mathrm{t}}+\left\{\left(\mathrm{s}_{\mathrm{p}}-\left(1-\mathrm{P}_{\mathrm{d}}\right)\right) \mathrm{R}_{\mathrm{po}}\right\} /\left(\mathrm{f}_{\mathrm{t}} \mathrm{f}_{\mathrm{p}}\right)+\left\{\left(1-\mathrm{P}_{\mathrm{d}}\right) \mathrm{R}_{\mathrm{po}}\right\} / \mathrm{f}_{\mathrm{pu}}\right]\right\}\left\{\mathrm{P}_{\mathrm{o}} \mathrm{~s}_{\mathrm{m}} \mathrm{C}_{\mathrm{m}}+\mathrm{P}_{\mathrm{o}} \mathrm{f}_{\mathrm{t}} \mathrm{~s}_{\mathrm{t}} \mathrm{C}_{\mathrm{t}}+\left\{\mathrm{P}_{\mathrm{o}} \mathrm{R}_{\mathrm{po}}\right.\right. \\
& \left.\left.\left[\left(\mathrm{s}_{\mathrm{p}}-\left(1-\mathrm{P}_{\mathrm{d}}\right)\right) \mathrm{f}_{\mathrm{t}} \mathrm{f}_{\mathrm{pd}}+\left(1-\mathrm{P}_{\mathrm{d}}\right) \mathrm{f}_{\mathrm{pu}}\right]+\left(1-\mathrm{P}_{\mathrm{o}}\right)\left[\mathrm{P}_{\mathrm{d}} \mathrm{f}_{\mathrm{t}} \mathrm{f}_{\mathrm{pd}}+\left(1-\mathrm{P}_{\mathrm{d}}\right) \mathrm{f}_{\mathrm{pu}}\right]\right\} \mathrm{C}_{\mathrm{p}}\right\}
\end{aligned}
$$

In the last factor we combine the terms with $\mathrm{f}_{\mathrm{t}} \mathrm{f}_{\mathrm{pd}}$ and with $\mathrm{f}_{\mathrm{pu}}$.

$$
\begin{align*}
& \left\{\mathrm{K}\left[\mathrm{~s}_{\mathrm{m}}+\mathrm{s}_{\mathrm{t}} / \mathrm{f}_{\mathrm{t}}+\left\{\left(\mathrm{s}_{\mathrm{p}}-\left(1-\mathrm{P}_{\mathrm{d}}\right)\right) \mathrm{R}_{\mathrm{po}}\right\} /\left(\mathrm{f}_{\mathrm{t}} \mathrm{f}_{\mathrm{pd}}\right)+\left\{\left(1-\mathrm{P}_{\mathrm{d}}\right) \mathrm{R}_{\mathrm{po}}\right\} / \mathrm{f}_{\mathrm{pu}}\right]\right\}\left\{\mathrm{P}_{\mathrm{o}} \mathrm{~s}_{\mathrm{m}} \mathrm{C}_{\mathrm{m}}+\mathrm{P}_{\mathrm{o}} \mathrm{f}_{\mathrm{t}} \mathrm{~s}_{\mathrm{t}} \mathrm{C}_{\mathrm{t}}+\left\{\left[\mathrm{P}_{\mathrm{o}} \mathrm{R}_{\mathrm{po}}\right.\right.\right. \\
& \left.\left.\left.\left.\left(\mathrm{s}_{\mathrm{p}}-\left(1-\mathrm{P}_{\mathrm{d}}\right)\right)+\left(1-\mathrm{P}_{\mathrm{o}}\right) \mathrm{P}_{\mathrm{d}}\right] \mathrm{f}_{\mathrm{t}} \mathrm{f}_{\mathrm{pd}}+\left(1-\mathrm{P}_{\mathrm{d}}\right)\left[\mathrm{P}_{\mathrm{o}} \mathrm{R}_{\mathrm{po}}+\left(1-\mathrm{P}_{\mathrm{o}}\right)\right] \mathrm{f}_{\mathrm{pu}}\right\} \mathrm{C}_{\mathrm{p}}\right\}\right) \tag{7.2}
\end{align*}
$$

### 7.3 Minimization

Define

$$
\begin{array}{ll}
\mathrm{a}_{\mathrm{m}}=\mathrm{s}_{\mathrm{m}} / \mathrm{s}_{\mathrm{m}}^{1 / 2} & \mathrm{~b}_{\mathrm{m}}=\left(\mathrm{P}_{\mathrm{o}} \mathrm{~s}_{\mathrm{m}} \mathrm{C}_{\mathrm{m}}\right)^{1 / 2} \\
\mathrm{a}_{\mathrm{t}}=\mathrm{s}_{\mathrm{t}} /\left(\mathrm{s}_{\mathrm{t}} \mathrm{f}_{\mathrm{t}}\right)^{1 / 2} & \mathrm{~b}_{\mathrm{t}}=\left(\mathrm{P}_{\mathrm{o}} \mathrm{f}_{\mathrm{t}} \mathrm{~s}_{\mathrm{t}} \mathrm{C}_{\mathrm{t}}\right)^{1 / 2} \\
\mathrm{a}_{\mathrm{pd}}=\left[\left(\mathrm{s}_{\mathrm{p}}-\left(1-\mathrm{P}_{\mathrm{d}}\right)\right) \mathrm{R}_{\mathrm{po}}\right] /\left[\left(\mathrm{s}_{\mathrm{p}}-\left(1-\mathrm{P}_{\mathrm{d}}\right)\right) \mathrm{R}_{\mathrm{po}} \mathrm{f}_{\mathrm{t}} \mathrm{f}_{\mathrm{pd}}\right]^{1 / 2} & \\
\mathrm{~b}_{\mathrm{pd}}=\left\{\left[\mathrm{P}_{\mathrm{o}} \mathrm{R}_{\mathrm{po}}\left(\mathrm{~s}_{\mathrm{p}}-\left(1-\mathrm{P}_{\mathrm{d}}\right)\right)+\left(1-\mathrm{P}_{\mathrm{o}}\right) \mathrm{P}_{\mathrm{d}}\right] \mathrm{f}_{\mathrm{t}} \mathrm{f}_{\mathrm{pd}} \mathrm{C}_{\mathrm{p}}\right\}^{1 / 2} \\
\mathrm{a}_{\mathrm{pu}}=\left[\left(1-\mathrm{P}_{\mathrm{d}}\right) \mathrm{R}_{\mathrm{po}}\right] /\left[\left(1-\mathrm{P}_{\mathrm{d}}\right) \mathrm{R}_{\mathrm{po}} \mathrm{f}_{\mathrm{pu}}\right]^{1 / 2} & \\
\mathrm{~b}_{\mathrm{pu}}=\left\{\left(1-\mathrm{P}_{\mathrm{d}}\right)\left[\mathrm{P}_{\mathrm{o}} \mathrm{R}_{\mathrm{po}}+\left(1-\mathrm{P}_{\mathrm{o}}\right)\right] \mathrm{f}_{\mathrm{pu}} \mathrm{C}_{\mathrm{p}}\right\}^{1 / 2} &
\end{array}
$$

So minimizing (7.2) is the same as minimizing

$$
\left(\mathrm{a}_{\mathrm{m}}^{2}+\mathrm{a}_{\mathrm{t}}^{2}+\mathrm{a}_{\mathrm{pd}}^{2}+\mathrm{a}_{\mathrm{pu}}^{2}\right)\left(\mathrm{b}_{\mathrm{m}}^{2}+\mathrm{b}_{\mathrm{t}}^{2}+\mathrm{b}_{\mathrm{pd}}^{2}+\mathrm{b}_{\mathrm{pu}}^{2}\right)
$$

By the Cauchy-Schwartz inequality this is minimized if and only if

$$
\mathrm{a}_{\mathrm{m}} / \mathrm{b}_{\mathrm{m}}=\mathrm{a}_{\mathrm{t}} / \mathrm{b}_{\mathrm{t}}=\mathrm{a}_{\mathrm{pd}} / \mathrm{b}_{\mathrm{pd}}=\mathrm{a}_{\mathrm{pu}} / \mathrm{b}_{\mathrm{pu}}
$$

Calculating and simplifying the four individual ratios we get

$$
\begin{align*}
& \mathrm{a}_{\mathrm{m}} / \mathrm{b}_{\mathrm{m}}=1 /\left(\mathrm{P}_{\mathrm{o}} \mathrm{C}_{\mathrm{m}}\right)^{1 / 2}  \tag{7.3}\\
& \mathrm{a}_{\mathrm{t}} / \mathrm{b}_{\mathrm{t}}=1 /\left[\left(\mathrm{P}_{\mathrm{o}} \mathrm{C}_{\mathrm{t}}\right)^{1 / 2} \mathrm{f}_{\mathrm{t}}\right]  \tag{7.4}\\
& \mathrm{a}_{\mathrm{pd}} / \mathrm{b}_{\mathrm{pd}}=\left[\left(\mathrm{s}_{\mathrm{p}}-\left(1-\mathrm{P}_{\mathrm{d}}\right)\right) \mathrm{R}_{\mathrm{po}}\right]^{1 / 2} /\left\{\left[\mathrm{P}_{\mathrm{o}} \mathrm{R}_{\mathrm{po}}\left(\mathrm{~s}_{\mathrm{p}}-\left(1-\mathrm{P}_{\mathrm{d}}\right)\right)+\left(1-\mathrm{P}_{\mathrm{o}}\right) \mathrm{P}_{\mathrm{d}}\right] \mathrm{C}_{\mathrm{p}}\right\}^{1 / 2} \mathrm{f}_{\mathrm{t}} \mathrm{f}_{\mathrm{pd}} \tag{7.5}
\end{align*}
$$

$$
\begin{equation*}
\mathrm{a}_{\mathrm{pu}} / \mathrm{b}_{\mathrm{pu}}=\mathrm{R}_{\mathrm{po}}^{1 / 2} /\left\{\left[\mathrm{P}_{\mathrm{o}} \mathrm{R}_{\mathrm{po}}+\left(1-\mathrm{P}_{\mathrm{o}}\right)\right] \mathrm{C}_{\mathrm{p}}\right\}^{1 / 2} \mathrm{f}_{\mathrm{pu}} \tag{7.6}
\end{equation*}
$$

Equating (7.3) and (7.4) we get

$$
\begin{equation*}
\mathrm{f}_{\mathrm{t}}=\left(\mathrm{C}_{\mathrm{m}} / \mathrm{C}_{\mathrm{t}}\right)^{1 / 2} \tag{7.7}
\end{equation*}
$$

Equating (7.4) and (7.5) we get

$$
\begin{equation*}
\mathrm{f}_{\mathrm{pd}}=\left[\mathrm{C}_{\mathrm{t}} \mathrm{P}_{\mathrm{o}} \mathrm{R}_{\mathrm{po}}\left(\mathrm{~s}_{\mathrm{p}}-\left(1-\mathrm{P}_{\mathrm{d}}\right)\right)\right]^{1 / 2} /\left\{\mathrm{C}_{\mathrm{p}}\left[\mathrm{P}_{\mathrm{o}} \mathrm{R}_{\mathrm{po}}\left(\mathrm{~s}_{\mathrm{p}}-\left(1-\mathrm{P}_{\mathrm{d}}\right)\right)+\left(1-\mathrm{P}_{\mathrm{o}}\right) \mathrm{P}_{\mathrm{d}}\right]\right\}^{1 / 2} \tag{7.8}
\end{equation*}
$$

Equating (7.3) and (7.6) we get

$$
\begin{equation*}
\mathrm{f}_{\mathrm{pu}}=\left(\mathrm{C}_{\mathrm{m}} \mathrm{P}_{\mathrm{o}} \mathrm{R}_{\mathrm{po}}\right)^{1 / 2} /\left\{\mathrm{C}_{\mathrm{p}}\left[\mathrm{P}_{\mathrm{o}} \mathrm{R}_{\mathrm{po}}+\left(1-\mathrm{P}_{\mathrm{o}}\right)\right]\right\}^{1 / 2} \tag{7.9}
\end{equation*}
$$

### 7.4 Minimization - No CATI Subsampling

Suppose we have no CATI subsampling (i.e. $\mathrm{f}_{\mathrm{t}}=1$ ), how does this affect the optimization?
Define
$\mathrm{a}_{\mathrm{mt}}=\left(\mathrm{s}_{\mathrm{m}}+\mathrm{s}_{\mathrm{t}}\right) /\left(\mathrm{s}_{\mathrm{m}}+\mathrm{s}_{\mathrm{t}}\right)^{1 / 2} \quad \mathrm{~b}_{\mathrm{mt}}=\left[\mathrm{P}_{\mathrm{o}}\left(\mathrm{C}_{\mathrm{m}} \mathrm{s}_{\mathrm{m}}+\mathrm{C}_{\mathrm{t}} \mathrm{s}_{\mathrm{t}}\right)\right]^{1 / 2}$
$a_{p d}$ and $b_{p d}$ are as in section 7.3, but with $f_{t}=1 . a_{p u}$ and $b_{p u}$ are exactly the same as section 7.3.
We do the same minimization as above. Calculating and simplifying the three individual ratios we get

$$
\begin{align*}
& \mathrm{a}_{\mathrm{mt}} / \mathrm{b}_{\mathrm{mt}}=\left\{\left(\mathrm{s}_{\mathrm{m}}+\mathrm{s}_{\mathrm{t}}\right) /\left[\mathrm{P}_{\mathrm{o}}\left(\mathrm{C}_{\mathrm{m}} \mathrm{~s}_{\mathrm{m}}+\mathrm{C}_{\mathrm{t}} \mathrm{~s}_{\mathrm{t}}\right)\right]\right\}^{1 / 2}  \tag{7.10}\\
& \mathrm{a}_{\mathrm{pd}} / \mathrm{b}_{\mathrm{pd}}=\left[\left(\mathrm{s}_{\mathrm{p}}-\left(1-\mathrm{P}_{\mathrm{d}}\right)\right) \mathrm{R}_{\mathrm{po}}\right]^{1 / 2} /\left\{\left[\mathrm{P}_{\mathrm{o}} \mathrm{R}_{\mathrm{po}}\left(\mathrm{~s}_{\mathrm{p}}-\left(1-\mathrm{P}_{\mathrm{d}}\right)\right)+\left(1-\mathrm{P}_{\mathrm{o}}\right) \mathrm{P}_{\mathrm{d}}\right] \mathrm{C}_{\mathrm{p}}\right\}^{1 / 2} \mathrm{f}_{\mathrm{pd}}  \tag{7.11}\\
& \mathrm{a}_{\mathrm{pu}} / \mathrm{b}_{\mathrm{pu}}=\mathrm{R}_{\mathrm{po}}^{1 / 2} /\left\{\left[\mathrm{P}_{\mathrm{o}} \mathrm{R}_{\mathrm{po}}+\left(1-\mathrm{P}_{\mathrm{o}}\right)\right] \mathrm{C}_{\mathrm{p}}\right\}^{1 / 2} \mathrm{f}_{\mathrm{pu}} \quad \text { (Note: same as (7.6)) } \tag{7.12}
\end{align*}
$$

Equating (7.10) and (7.11) we get

$$
\begin{align*}
\mathrm{f}_{\mathrm{pd}}= & \left\{\left[\left(\mathrm{C}_{\mathrm{m}} \mathrm{~s}_{\mathrm{m}}+\mathrm{C}_{\mathrm{t}} \mathrm{~s}_{\mathrm{t}}\right) /\left(\mathrm{s}_{\mathrm{m}}+\mathrm{s}_{\mathrm{t}}\right)\right] \mathrm{P}_{\mathrm{o}} \mathrm{R}_{\mathrm{po}}\left(\mathrm{~s}_{\mathrm{p}}-\left(1-\mathrm{P}_{\mathrm{d}}\right)\right)\right\}^{1 / 2} /\left\{\mathrm { C } _ { \mathrm { p } } \left[\mathrm{P}_{\mathrm{o}} \mathrm{R}_{\mathrm{po}}\left(\mathrm{~s}_{\mathrm{p}}-\left(1-\mathrm{P}_{\mathrm{d}}\right)\right)+(1-1.13)\right.\right.
\end{align*}
$$

Equating (7.10) and (7.12) we get

$$
\begin{equation*}
\mathrm{f}_{\mathrm{pu}}=\left\{\left[\left(\mathrm{C}_{\mathrm{m}} \mathrm{~s}_{\mathrm{m}}+\mathrm{C}_{\mathrm{t}} \mathrm{~s}_{\mathrm{t}}\right) /\left(\mathrm{s}_{\mathrm{m}}+\mathrm{s}_{\mathrm{t}}\right)\right] \mathrm{P}_{\mathrm{o}} \mathrm{R}_{\mathrm{po}}\right\}^{1 / 2} /\left\{\mathrm{C}_{\mathrm{p}}\left[\mathrm{P}_{\mathrm{o}} \mathrm{R}_{\mathrm{po}}+\left(1-\mathrm{P}_{\mathrm{o}}\right)\right]\right\}^{1 / 2} \tag{7.14}
\end{equation*}
$$

### 8.0 Results

What are the optimal subsampling rates? Using (7.7), (7.8), and (7.9), we calculate the optimal subsampling rates as:

- $\mathrm{f}_{\mathrm{t}}=0.648863$
- $\mathrm{f}_{\mathrm{pd}}=0.519043$
- $\mathrm{f}_{\mathrm{pu}}=0.374116$

If we assume that $f_{t}=1$, and use (7.13) and (7.14) to calculate the optimal subsampling rates we get:

- $\mathrm{f}_{\mathrm{pd}}=0.372223$
- $\mathrm{f}_{\mathrm{pu}}=0.413479$

What is the affect on the variance and total cost for these optimal rates as compared to the current rates. We assume an annual sampling rate of 2.5 percent and an estimate of 10 percent. The standard error will be calculated for an average tract which has 4000 people, which means an annual initial sample of 100 people and a sample over five years of 500 people. For the calculation of the standard error, we use a design factor of 1.6.

Table 1. Estimated Variances and Total Cost for Different Subsampling Rates

| Variable | Current Rates | Optimum with $\mathrm{f}_{\mathrm{t}}$ not equal to 1 |  | Optimum with $\mathrm{f}_{\mathrm{t}}=1$ |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Actual Rates | Rounded Rates | Actual Rates | Rounded <br> Rates 1 | Rounded <br> Rates 2 |
| $\mathrm{f}_{\mathrm{t}}$ | 1.000000 | 0.648863 | 0.666667 | 1.000000 | 1.000000 | 1.000000 |
| $\mathrm{f}_{\mathrm{pd}}$ | 0.333333 | 0.519043 | 0.500000 | 0.372223 | 0.400000 | 0.333333 |
| $\mathrm{f}_{\mathrm{pu}}$ | 0.666667 | 0.374116 | 0.400000 | 0.413479 | 0.400000 | 0.400000 |
| Standard Error | 0.027972 | 0.028769 | . 028754 | 0.027466 | 0.027011 | 0.028280 |
| Relative Change in Standard Error from Current |  | 2.85\% | 2.79\% | -1.81\% | -3.44\% | 1.10\% |
| Coefficient of Variation | 27.97\% | 28.77\% | 28.75\% | 27.47\% | 27.01\% | 28.28\% |
| 90\% Confidence Interval | $\begin{gathered} 5.40 \%, \\ 14.60 \% \end{gathered}$ | 5.27\%, 14.73\% | $\begin{gathered} 5.27 \%, \\ 14.73 \% \end{gathered}$ | $\begin{gathered} 5.48 \%, \\ 14.52 \% \end{gathered}$ | $\begin{gathered} 5.56 \%, \\ 14.44 \% \end{gathered}$ | $\begin{gathered} 5.35 \%, \\ 14.65 \% \end{gathered}$ |
| Total Cost | 115,800,000 | 105,950,000 | 106,100,000 | 117,950,000 | 122,140,000 | 111,580,000 |

### 9.0 Conclusions

The results suggest that the efficiency of the ACS could be improved by starting the subsampling in the CATI phase. With this change the standard error would be about 3 percent larger, but the cost would be reduced by about $\$ 10$ million. The other option which would save money is the last column in Table 1. Under this scenario the only subsampling rate that changes is for the unmailables from 2-in-3 to 2-in-5, and this would save about $\$ 4$ million.
