## Introduction

The American Community Survey (ACS) prides itself on its ability to produce valuable and useful estimates that meet the Census Bureau's quality standards for reliability. The release of the new 2014 Supplemental Table data products seeks to continue the ACS's tradition under less restrictive data requirements.

Currently, regular ACS 1-year tables and products adhere to a population threshold requirement of 65,000 . Under this requirement, geographies with populations less than 65,000 do not receive estimates using ACS 1-year data.

For the 2014 Supplemental Tables, the population threshold was lowered to 20,000. Through the Supplemental Table release, geographies with populations of 20,000 to 65,000 will now receive estimates using ACS 1-year data. The 2014 Supplemental Tables were designed to contain more general characteristics with the intent that the reliability of the estimates for geographies with populations less than 65,000 may be comparable to that of the more detailed, regular ACS 1-year products.

The release of the 2014 Supplemental Tables will aid many users who seek data on geographies with smaller populations. However, lowering the population threshold below 65,000 does carry consequences. This analysis seeks to inform users on the limitations incurred by lowering 2014 Supplemental Tables the threshold. For this purpose, estimates for new geographies with populations less than 65,000 receive the most focus.

## Research Questions

The results of the data quality filtering for the regular ACS 1-year data products are the benchmark against which the Supplemental Tables are compared. ${ }^{1}$ Again, a goal in the creation of the Supplemental Tables was that their estimates be comparable in reliability to the regular ACS 1-year. Were a large percentage of estimates in the Supplemental Tables repressed due to data filtering, the usefulness of the new product would be undermined. Looking to the new Supplemental Tables, three research questions therefore emerge:

1. With the regular data quality filtering rules applied, how do the overall filtering rates of the Supplemental Tables compare to each other by population size ranges and to the regular ACS 1-year data products?
2. With the regular data quality filtering rules applied, how does the reliability of published estimates compare between areas of population 20,000 to 65,000 and areas of population 65,000 or more?
3. Based on the reliability results of published estimates for areas of population 20,000 to 65,000 , are there particular tables or estimates within tables that data users should use with caution?
[^0]
## Background

As with the ACS 1-year published tables, the coefficient of variation (CV) is used to evaluate data reliability for data quality filtering purposes. Essentially, the CV is a measure of the sampling variability in the estimate; it is calculated by dividing the estimate's standard error (SE) by the estimate itself. The standard error of an estimate is a measure of the variability in the data. From the standard error also comes the margin of error (MOE), which is the maximum difference between a true population parameter and the calculated estimate of that parameter at a specified confidence level.

When the MOE of an estimate is greater than or equal to the estimate itself, that estimate is not significantly different from zero. At a $90 \%$ confidence level, a CV value of 0.61 or higher means that the MOE is greater than or equal to its estimate. The ACS data quality filtering process therefore uses the value 0.61 to compare against the CV values of estimates. The higher the CV value, the less reliable the estimate is considered to be.

The ACS data quality filtering process uses the CV values of all detailed line estimates within a table to determine whether the table will be published. ${ }^{2}$ If at least half of the estimates in a table have a CV value greater than 0.61 , the table fails and is not published.

The CVs for zero count estimates are treated as a special case in the ACS data quality filtering process. The normal calculation of the CV results in a zero as the denominator of the formula, which leaves the CV value undefined. Because of this, for data quality filtering, the CV value for zero count estimates is assigned a default value of 1.0. Zero count estimates are most common in highly detailed tables and tables for smaller geographies, and increase the chance that these tables fail filtering rules.

In the regular ACS 1-year products, the current data quality filtering procedure removes about $48 \%$ of estimates from publication because they are in tables with median CV values greater than or equal to 0.61 . Broken out by data reliability, filtering rules have removed about $90 \%$ of estimates with undefined CV values (i.e. zero estimates) and about $70 \%$ of unreliable estimates where the CV value is greater than 0.61 . Filtering rules have also removed about $40 \%$ of estimates with CV values between 0.30 and 0.61 and about $16 \%$ of estimates with CV values less than 0.30.

Though population thresholds and data quality filtering do help, current filtering rules do not remove all estimates with questionable reliability from publication. The filtering rates of produced tables, as well as the distribution of CV values, give an indication of the potential reliability of published estimates. The results section below provides an initial assessment of the reliability of estimates in the new 2014 Supplemental Tables.

[^1]
## Results

## Data Quality Filtering Rates

With the population threshold of 65,000 , about $37 \%$ of regular ACS 1-year tables fail data quality filtering rules. A goal in the design of the Supplemental Table release was to create tables with lower filtering rates. A quick analysis confirms that this goal was realized. Table 1 outlines the overall filtering rates of tables by geographic area population size.

## Table 1: Supplemental Table Filtering Rates by Geography Size ${ }^{2}$

| Geography Size | Number of Tables | Number of Filtered Tables | Percent of Tables Filtered |
| :---: | ---: | ---: | ---: |
| Greater than 65,000 | 414,323 | 494 | $0.12 \%$ |
| Less than 65,000: | 385,880 | 13,622 | $3.53 \%$ |
| $25,000-65,000$ | 288,003 | 7,430 | $2.58 \%$ |
| $20,000-25,000$ | 97,877 | 6,192 | $6.33 \%$ |

For more information visit https://www.census.gov/acs
As Table 1 shows, the overall filtering rates for the Supplemental Tables are consistently lower than the regular ACS 1-year product filtering rate of about 37\%. Within the Supplemental Tables, however, filtering rates are generally higher for smaller geographies than for larger ones. For instance, about $45 \%$ of all of the filtered tables for geographies less than 65,000 in size are for the smallest geographies (less than 25,000 in size). However, by count, geographies with populations less than 25,000 account for only about $25 \%$ of all of the Supplemental Tables for new geographies (geographies with populations less than 65,000 ). Appendix 1 contains a breakdown of the filtering rates by table and geography size for the new Supplemental Tables.

Of the Supplemental Tables, "Race" (K200201), "Group Quarters" (K202601) and "Household Language" (K201601) showed some of the highest filtering rates across the new geographies. For geographies with populations less than 25,000, tables K202507 ("Gross Rent") and K201703 ("Poverty Status in the Past 12 Months of Families by Household Type") also displayed filtering rates greater than or equal to thirty percent. The Supplemental Tables that contain some of the highest filtering rates for new geographies are highlighted in Table 2.

Table 2: Filtering Rates for Select Supplemental Tables

| Table ID | Greater than 65,000 | $25,000-65,000$ | $20,000-25,000$ |
| :---: | ---: | ---: | ---: |
| K200201 | $1.0 \%$ | $31.8 \%$ | $63.2 \%$ |
| K202601 | $3.7 \%$ | $26.3 \%$ | $46.9 \%$ |
| K201601 | $0.5 \%$ | $21.7 \%$ | $47.5 \%$ |
| K202507 | $0.5 \%$ | $13.9 \%$ | $33.7 \%$ |
| K201703 | $0.0 \%$ | $9.7 \%$ | $30.1 \%$ |

## Reliability of Published Estimates

In general, estimates for smaller geographies tend to have higher CV values. Appendix 2 displays a breakdown of the Supplemental Table estimates CV values by table ID and line. Though data variability does not pose an issue for most of the estimates provided in the Supplemental Tables, it is important to explore the challenges that arise when the population threshold is set below 65,000 .

Estimates for geographies with populations greater than 65,000 (similar to those already published in the regular 2014 ACS 1-year release) have the lowest CV values. Table 3 displays an overall distribution of CV values by geography size for the Supplemental Tables.

Table 3: Coefficients of Variation Distributions by Geography Size

| Geography Size | Number of Published <br> Estimates | Percent of Estimates with <br> CV <0.30 | Percent of Estimates with <br> CV <0.61 |
| :---: | ---: | ---: | ---: |
| Greater than 65,000 | $2,547,108$ | $92.6 \%$ | $97.8 \%$ |
| $25,000-65,000$ | $1,725,509$ | $76.0 \%$ | $93.0 \%$ |
| $20,000-25,000$ | 561,804 | $67.0 \%$ | $90.0 \%$ |

Source: U.S. Census Bureau, 2014 American Community Survey Supplemental Tables
For more information, visit https://www.census.gov/acs
Estimates with CV values less than 0.30 have higher reliability than those with CV values between 0.30 and 0.61 . As Table 3 shows, estimates for larger geographies are generally more reliable than estimates for smaller geographies. Tracking the CV values across geography sizes makes this negative correlation clear. Interestingly, as shown in Table 4, the proportion of estimates with CV values greater than 0.30 increases as geography size grows smaller.

Table 4: Estimates with Large Coefficients of Variation Distribution Shifts

| Geography Size | Table ID | Estimate | CV < 0.30 | $0.30<\mathrm{CV}<0.61$ | CV > 0.61 | Estimate $=0$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Greater than 65,000 | K201101 | Male <br> Householder; No Wife Present | 53.3\% | 44.6\% | 2.1\% | 0.0\% |
| 25,000-65,000 |  |  | 2.9\% | 58.6\% | 34.8\% | 3.7\% |
| 20,000-25,000 |  |  | 0.4\% | 38.3\% | 52.6\% | 8.7\% |
| Greater than 65,000 | K201801 | With a Disability Under 18 years | 62.4\% | 36.0\% | 1.6\% | 0.0\% |
| 25,000-65,000 |  |  | 5.4\% | 61.7\% | 29.7\% | 3.2\% |
| 20,000-25,000 |  |  | 0.9\% | 40.8\% | 50.6\% | 7.7\% |
| Greater than 65,000 | K202402 | FederalGovernmentWorkers | 63.4\% | 34.5\% | 1.9\% | 0.2\% |
| 25,000-65,000 |  |  | 8.4\% | 55.3\% | 32.9\% | 3.3\% |
| 20,000-25,000 |  |  | 2.7\% | 37.6\% | 50.6\% | 9.2\% |

For each example in Table 4, the majority of the CV values for each estimate shifts for each move in population level. Take, for instance, the "Male Householder; No Wife Present" estimate in table K201101 ("Own Children Under 18 Years by Family Type"). For geographies greater than 65,000 , this estimate is largely reliable, having a majority of CV values less than 0.30 . For geographies between 25,000 and 65,000 , reliability decreases, with the majority of CV values between 0.30 and 0.61 . Finally, at the smallest geography size of between 20,000 and 25,000 , estimates are mostly unreliable, with the majority share of CV values greater than 0.61.Table 5 outlines more estimates that display high unreliability at the smallest geography size.

Table 5: Estimates with a Majority of Coefficients of Variation Values Greater than 0.61

|  |  | Ereater than 65,000 |  | $25,000-65,000$ |  | $20,000-25,000$ |  |
| :--- | :---: | ---: | ---: | ---: | ---: | ---: | ---: |
| Table ID | Estimate | CV >0.61 | Estimate $=0$ | CV $>0.61$ | Estimate $=0$ | CV > 0.61 | Estimate $=0$ |
| K200503 | Native; born Outside the U.S. | $1.7 \%$ | $0.0 \%$ | $33.5 \%$ | $3.6 \%$ | $51.3 \%$ | $11.9 \%$ |
| K201703 | Below Poverty Level: Male <br> Householder; No Wife Present | $24.2 \%$ | $4.4 \%$ | $54.4 \%$ | $26.9 \%$ | $53.7 \%$ | $36.1 \%$ |
| K202101 | Veteran: 18 to 34 years | $12.4 \%$ | $1.3 \%$ | $50.7 \%$ | $15.9 \%$ | $56.8 \%$ | $28.7 \%$ |
| K202403 | Information Industry | $2.0 \%$ | $0.1 \%$ | $30.8 \%$ | $4.5 \%$ | $50.2 \%$ | $11.2 \%$ |
| K202701 | Under 18 years: No Health <br> Insurance Coverage | $5.2 \%$ | $0.2 \%$ | $42.3 \%$ | $8.5 \%$ | $54.2 \%$ | $19.1 \%$ |
| K202801 | With Dial-up Internet <br> Subscription Only | $19.3 \%$ | $2.4 \%$ | $51.5 \%$ | $22.3 \%$ | $50.5 \%$ | $36.2 \%$ |

The examples in Table 5 are the estimates with the highest proportions of CV values greater than 0.61 for areas with populations less than 25,000 . These estimates passed the data quality filtering process because more than half of all the estimates in their entire table were below 0.61. It is important to recall that, as with the regular 1-year ACS data products, the data quality filtering process does not guarantee that all estimates within a table are reliable; rather, filtering guarantees that a majority of estimates in a table meet reliability requirements. Users should proceed with a cautious understanding that the estimates reliability may be inconsistent both within a table and across geography sizes.

Still more estimates may be globally unreliable as they contain a majority distribution of zero estimates. A zero estimate does not mean that there is no population with the characteristic in the given geography. Rather, it indicates that no persons with the given characteristic were in the interviewed sample. For data quality filtering purposes, zero estimates are assigned a CV value of 1.0 since the CV formula gives an undefined value. Tables with a large number of zero estimates are more likely to fail filtering rules. Table 6 shows examples of estimates that may have reliability issues due to zero estimate counts.

## Table 6: Estimates with a Majority Distribution of Zero Estimates

| Table ID | Estimate | Greater than 65,000 |  | 25,000-65,000 |  | 20,000-25,000 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | CV > 0.61 | Estimate $=0$ | CV > 0.61 | Estimate $=0$ | CV > 0.61 | Estimate $=0$ |
| K200102 | Population in Group Quarters | 48.7\% | 10.8\% | 49.5\% | 46.7\% | 35.1\% | 62.9\% |
| K200201 | Native Hawaiian and Other Pacific Islander alone | 38.7\% | 36.8\% | 20.9\% | 76.5\% | 16.9\% | 81.0\% |
| K202301 | Employed in Armed Forces | 35.3\% | 29.1\% | 24.5\% | 68.1\% | 15.4\% | 81.3\% |
| K202402 | Unpaid Family Workers | 44.1\% | 21.2\% | 37.1\% | 61.2\% | 24.8\% | 74.5\% |
| K202507 | With Cash Rent: \$2000 or more | 19.6\% | 10.1\% | 27.7\% | 44.5\% | 23.7\% | 61.1\% |
| K202509 | Housing Value: $\$ 1,000,000$ or more | 26.9\% | 9.7\% | 37.4\% | 45.7\% | 32.4\% | 58.4\% |
| K202701 | 65 years and Over: No Health Insurance Coverage | 40.9\% | 20.8\% | 31.1\% | 66.4\% | 21.0\% | 78.2\% |

Filtering rules define the estimates in Table 6 as unreliable. However, some of these estimates may be largely inapplicable for smaller geographies. For instance, there may not be many houses with a value of $\$ 1,000,000$ or more in geographies with a population under 25,000 (table K202509). Having a zero estimate for this line may be understandable and perhaps expected for data users. The user should therefore cautiously evaluate estimates that are unreliable due to zero estimate counts on a case-to-case basis to determine if they are suitable for use.

Sometimes, the combined effect of high zero estimate counts and high CV values has a large impact on data reliability. This combined effect leads to a third type of data reliability issue, as shown in Table 7.

Table 7: Estimates with Combined High Coefficients of Variation and Zero Estimate Values

| Table ID | Estimate | Greater than 65,000 |  | 25,000-65,000 |  | 20,000-25,000 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | CV > 0.61 | Estimate $=0$ | CV > 0.61 | Estimate $=0$ | CV > 0.61 | Estimate $=0$ |
| K200201 | American Indian or Alaska Native Alone | 24.6\% | 4.3\% | 46.2\% | 27.0\% | 40.1\% | 36.5\% |
| K200701 | Moved from Abroad | 20.0\% | 2.0\% | 53.1\% | 25.4\% | 48.8\% | 43.0\% |
| K200801 | Public Transportation (excluding taxicab) | 14.9\% | 3.4\% | 35.5\% | 23.7\% | 34.6\% | 35.8\% |
| K201401 | Graduate or Professional School | 1.0\% | 0.1\% | 26.2\% | 2.5\% | 46.9\% | 9.4\% |
| K201601 | Spanish: Limited English Speaking Household | 17.5\% | 6.1\% | 33.7\% | 29.0\% | 30.8\% | 39.3\% |
| K201601 | Other Languages: Limited English Speaking Household | 18.1\% | 5.0\% | 38.6\% | 25.0\% | 38.1\% | 35.3\% |
| K202403 | Agriculture, Forestry, Fishing and Hunting, Mining Industry | 17.8\% | 4.0\% | 37.6\% | 19.8\% | 39.6\% | 28.1\% |
| K202505 | Housing Unit Built 2010 or later | 7.1\% | 1.7\% | 34.7\% | 13.3\% | 45.1\% | 21.7\% |
| K202509 | Housing Value \$500,000 to \$999,999 | 7.2\% | 2.5\% | 31.2\% | 17.2\% | 36.4\% | 27.6\% |

Source: U.S. Census Bureau, 2014 American Community Survey Supplemental Tables
For more information, visit https://www.census.gov/acs
As Table 7 illustrates, it is important for users to look to both the "CV >0.61" and the "Estimate $=0$ " columns in Appendix 2 together to examine global estimate reliability. For instance, the "Graduate or Professional School Estimate" in table K201401 ("School Enrollment by Level of School for the Population 3 Years and Over") may look acceptable if only the zero count figure of $9.4 \%$ is examined. However, when this figure is combined with the "CV >0.61" percentage of $46.9 \%$, it is clear that the reliability of the line is questionable. Users should therefore consider the combined effect of CV values and zero estimate counts when examining overall data reliability.

It is therefore advisable that users consult Appendix 2 to examine the CV values and zero count estimates before they use the new Supplemental Tables. Again, as with the previously published ACS 1-year estimates, filtering rules cannot provide a guarantee that all estimates in a table are
completely reliable. However, Appendix 2 can give users more guidance on the estimate reliability.

## Conclusion

The new Supplemental Tables can be a great resource for users to get single year information about smaller geographies than are published in regular ACS 1-year data products. The research questions in this paper explore the limitations of the new Supplemental Tables in order to inform users of the data's reliability focusing on geographies with populations between 20,000 and 65,000.

When compared to regular 1-year ACS data products, the Supplemental Tables generally display lower filtering rates, as shown in Table 1. Overall, fewer of the new product tables were suppressed by data quality filtering than were the regular 1-year products. However, within the 2014 Supplemental Table release, filtering rates generally increase as geography size decreases. The overall filtering rates of the Supplemental Tables for geographies with populations greater than 65,000 are lower than the overall filtering rates for geographies with populations between 20,000 and 65,000 . Appendix 1 supplies more detail on the filtering rates of individual tables.

Likewise, with regular filtering rates applied, the reliability of estimates for geographies with populations between 20,000 and 65,000 is generally lower than the reliability of estimates for geographies with populations greater than 65,000. As discussed earlier, users should reference Appendix 2 to find information on the CV values of the estimates they wish to use. Though a majority of the estimates released have high data reliability ( CV values less than 0.30 ), there are some estimates that should only be used with caution. Examples of estimates in tables that may be unreliable at smaller geographies due to CV values greater than 0.61 and zero estimate counts are outlined in Table 4 through Table 7.

Both appendices are useful tools for users to be able to check the reliability of the tables that they are interested in using. Filtering rates and CV values vary by estimate, especially in the tables for geographies less than 25,000 in size. Users should therefore understand the reliability risks as well as the reasons behind them when using the Supplemental Table estimates.

Moreover, as the data quality filtering process is the same for both the Supplemental Tables and the regular ACS 1-year data products, users can apply the methods of analysis used here to the regular ACS 1-year (and 5-year) data products. The techniques of examining CV values, zero estimate counts and overall filtering rates to determine the usefulness and reliability are applicable across ACS data products. The same amount of caution should therefore be taken toward 1-year and 5-year data products that show the results explicated in Table 4 through Table 7.

Overall, the new Supplemental Tables achieved the goals set out for this data product. These tables have lower filtering rates than the regular ACS 1-year data products and, though the characteristics of their estimates may be less detailed than regular ACS 1-year data products, their reliability is comparable. The 2014 Supplemental Tables therefore continue in the ACS tradition of providing useful and valuable estimates and remain a great resource for users who are seeking information on smaller geographies.
