

Response behaviour in mixed-mode surveys

Fannie Cobben

Statistics Netherlands

In this presentation

- Re-design of Dutch household surveys
- Response behaviour in the LFS 2010
- Conclusion & discussion

Re-design of Dutch household surveys (1)

Motivation for re-design:

- Flexibility
- Coherency
- Costs reductions

without a loss of quality.

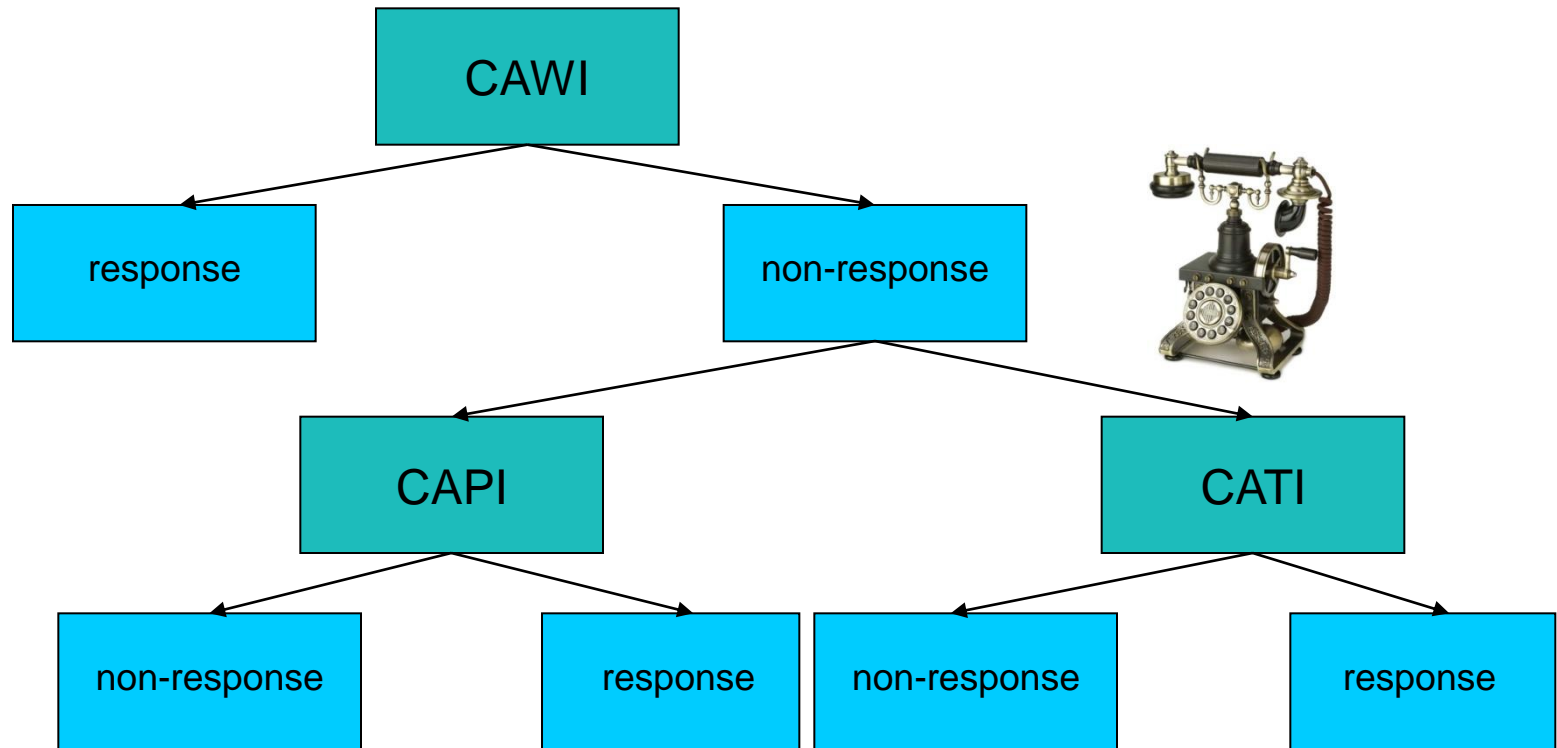

Re-design of Dutch household surveys (2)

Main ingredients of re-design:

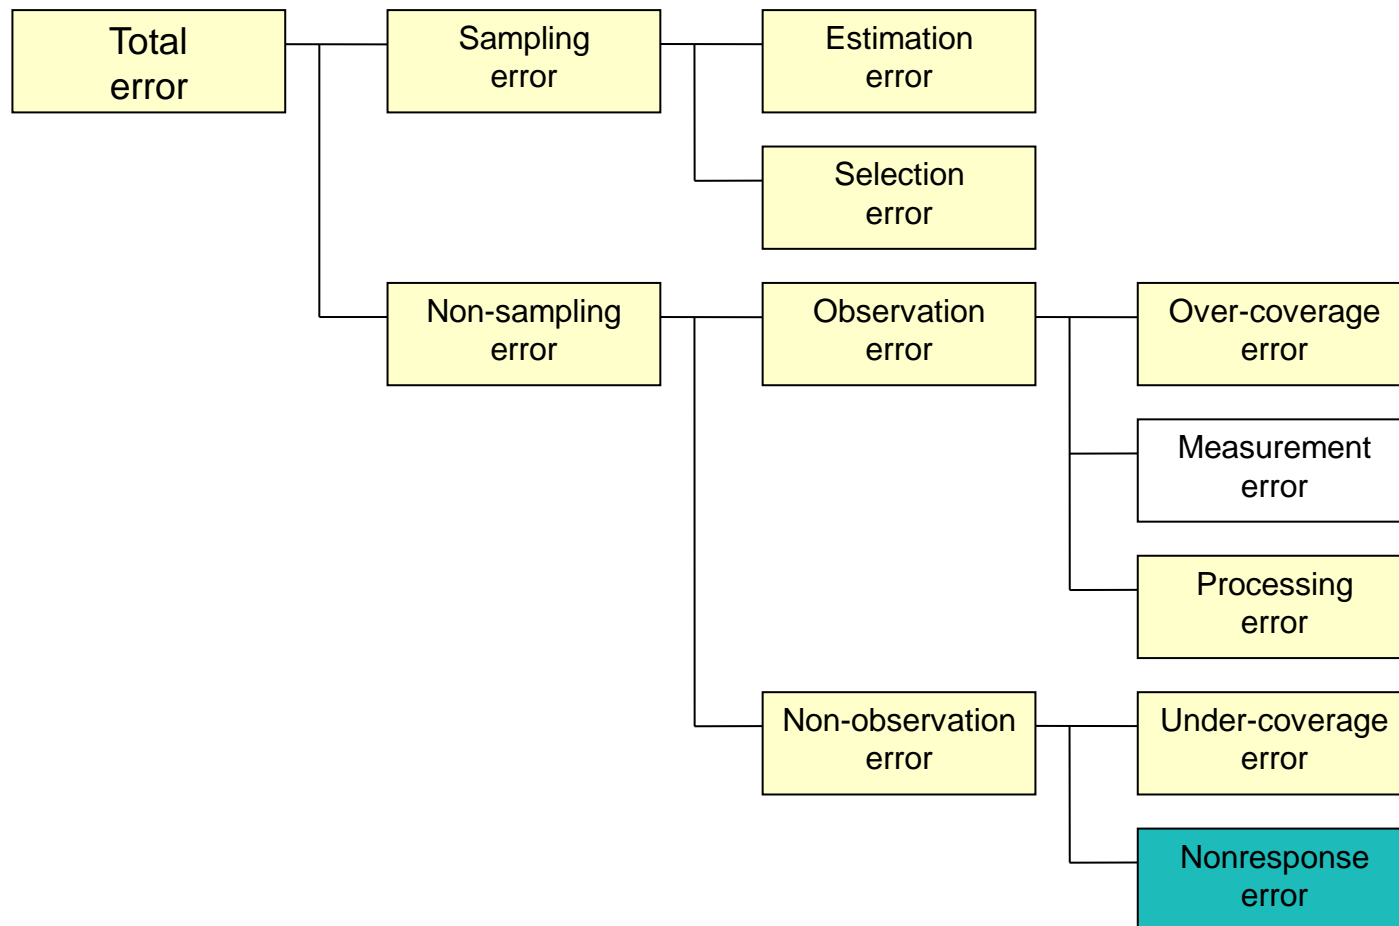

- Core questionnaire
- Use of register information
- Model based estimation
- Quality framework
- Parallel runs of old and new designs
- Mixed-mode datacollection

Re-design of Dutch household surveys (3)

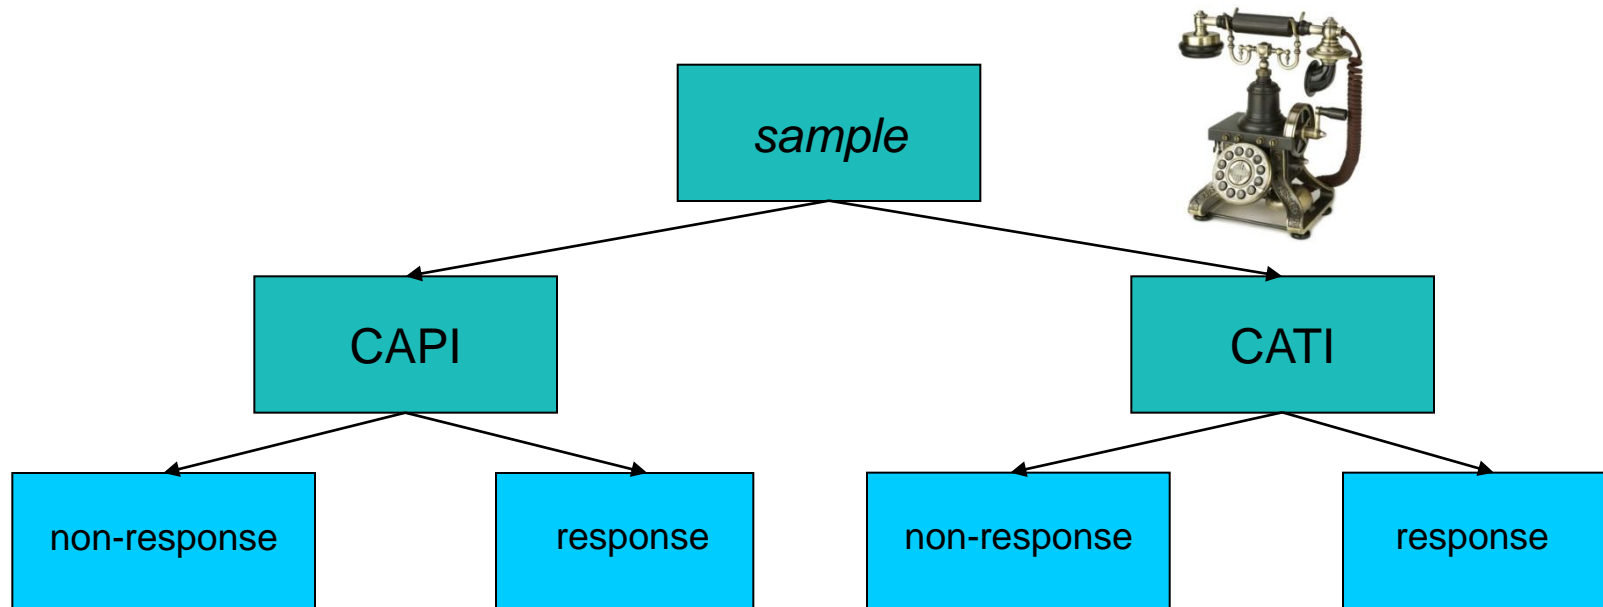

General mixed-mode design:

INTERMEZZO: Total Survey Error

Mixed-mode design for the first round of the LFS in 2010

Response behaviour in the LFS 2010 (1)

Data from **parallel run** January 2010 - July 2010 (6 months)

<i>Design</i>	<i>Group</i>	<i>RR</i>	<i>RR</i>
Old	No telephone	59,5	53,3
	Telephone		63,0
New	CAPI	53,9	53,2
	CATI		54,3

Response behaviour in the LFS 2010 (2)

Compare response behaviour in the different modes by using the R-indicator:

$$R(\rho) = 1 - 2S(\rho) = 1 - 2\sqrt{\frac{1}{N-1} \sum_{i=1}^n d_i (\phi_i - \bar{\rho})^2}$$

and conditional partial R-indicators:

$$P_C(X_k) = \sqrt{\frac{1}{N} \sum_{l=1}^L \sum_{i \in U_l} d_i (\phi_i - \bar{\rho}_l)^2}$$

INTERMEZZO: What you need to know about the R-indicator

- Based on estimated response propensities
- Interpretation with respect to variables used to model response propensities
- Transformed to the [0,1] interval: 0 not representative; 1 perfect representativity
- *Conditional partial R-indicators* isolate that part of the deviation of representative response, i.e. the selectivity, that is attributable to one variable.
- Hence, the lower the better.

RISQ

Representativity Indicators
for Survey Quality

Response behaviour in the LFS 2010 (3)

R-indicator – for total and telephone/no telephone group

X-variables: degree of urbanization, average house value, type of household, age, ethnic group and paid job

	Group	$\hat{R}(\hat{\rho})$	CI	$\hat{R}(\hat{\rho})$	CI
Old design	<i>No telephone</i>	84,9	84,1 – 85,6	82,9	81,7 – 84,1
	<i>Telephone</i>			88,7	87,8 - 89,7
New design	<i>CAPI</i>	85,2	84,5 – 86,0	84,5	83,2 – 85,7
	<i>CATI</i>			82,7	81,8 – 83,6

New design seems better representative; however CATI is significantly worse.

Response behaviour in the LFS 2010 (4)

Conditional partial R-indicators – total

	Old design	New design
<i>Paid job</i>	0,009	0,018
<i>Degree of urbanization</i>	0,018	0,016
<i>Type of household</i>	0,015	0,019
<i>Average house value</i>	0,023	0,014
<i>Age</i>	0,017	0,015
<i>Ethnic group</i>	0,039	0,039

Response behaviour in the LFS 2010 (5)

Conditional partial R-indicators - telephone/no telephone group

	<i>Old design</i>		<i>New design</i>	
	<i>No telephone</i>	<i>Telephone</i>	<i>CAPI</i>	<i>CATI</i>
<i>Paid job</i>	0,010	0,008	0,015	0,019
<i>Degree of urbanization</i>	0,023	0,013	0,023	0,015
<i>Type of household</i>	0,011	0,014	0,019	0,025
<i>Average house value</i>	0,022	0,022	0,016	0,023
<i>Age</i>	0,029	0,014	0,028	0,030
<i>Ethnic group</i>	0,046	0,026	0,043	0,040

Response behaviour in the LFS 2010 (6)

Conditional partial R-indicators for **telephone group** – category level

Paid job

	Old design	New design
Yes	0,006	0,015
No	0,005	0,012

Response behaviour in the LFS 2010 (7)

Conditional partial R-indicators for **telephone group** – category level

Type of household

	Old design	New design
<i>Single</i>	0,009	0,012
<i>Single parent</i>	0,005	0,013
<i>Couple without children</i>	0,003	0,004
<i>Couple with children</i>	0,008	0,013
<i>Else</i>	0,005	0,011

Response behaviour in the LFS 2010 (8)

Conditional partial R-indicators for **telephone group** – category level

Age

	Old design	New design
15-19	0,001	0,004
20-24	0,003	0,015
25-29	0,005	0,014
30-34	0,004	0,006
35-39	0,005	0,003
40-44	0,007	0,005
45-49	0,005	0,005
50-54	0,002	0,005
55-59	0,003	0,012
60-64	0,007	0,012

Response behaviour in the LFS 2010 (9)

Conditional partial R-indicators for **telephone group** – category level

Ethnic group

	Old design	New design
<i>Dutch background</i>	0,012	0,018
<i>1st generation Western background</i>	0,005	0,013
<i>2nd generation Western background</i>	0,003	0,004
<i>1st generation non-Western background</i>	0,016	0,030
<i>2nd generation non-Western background</i>	0,012	0,013
<i>Background unknown</i>	0,010	0,008

After explaining to a student through various lessons and examples that:

$$\lim_{x \rightarrow 8} \frac{1}{x-8} = \infty$$

I tried to check if she really understood that, so I gave her a different example.

This was the result:

$$\lim_{x \rightarrow 5} \frac{1}{x-5} = \infty$$

Conclusion

- *Representativity of the response is only one of the aspects of quality*
- The R-indicator can be used to compare response behaviour in different modes
- Selectivity of CATI response is caused by:
 - Single and single parent households
 - Age categories 20 - 29 and 55 – 64
 - First generation persons with a non-Dutch background

Discussion

- Total survey error
- Different fieldwork strategies for different groups, based on total survey error
- Introduction of Internet is expected to reduce response selectivity. But how will the sequential design influence response behaviour?

Thank you for your attention!
